# ASTAR Operational Evaluation: Conclusions and Recommendations

**Oft, Simulator Assessment Routine (ASTAR)** is an automated decision aid designed to assist a training system analyst to predict the effectiveness of a training device during its development (Rose, Martin & Wheaton, 1988). ASTAR was developed to provide a systematic and analytic evaluation procedure to aid training device design and acquisition.

The final phase of the ASTAR development process was to conduct "field testing" in order to demonstrate the operational utility of ASTAR. The objective was to compare and contrast ASTAR to other automated Device Effectiveness Technologies (DETs) and formulate a plan to implement ASTAR as a standard evaluation technique within the DoD Instructional System Development (ISD) process. The operational evaluation was accomplished through a series of integrated tests. The tests assessed the operational utility and impact of ASTAR on existing and new training systems. These tests examined performance, utility, and user issues with regard to ASTAR. While the concept of ASTAR was well received by the operational analysts, the current implementation of ASTAR achieved poor user acceptance. ASTAR will require (over)
19. (Cont.) extensive enhancement before it can gain general user acceptance. A functional description for an improved ASTAR was developed to address the problems of ASTAR. It is recommended that any further developmental action on ASTAR be limited to the design described in the ASTAR Functional Description included in this report, or a totally new effort to develop a technique for estimating training effectiveness.
ACKNOWLEDGEMENTS

Appreciation is expressed to the following persons for their contributions to this study:

Maj. Wes Woodruff, USAF, NAVTRASYSCEN Liaison Office, Orlando, FL, Dr. Michael Singer, ARI, Field Office, Orlando, FL, and Mr. Tim Whitten, NAVTRASYSCEN, Orlando, FL, for their participation in the Project Advisory Group.

Mr. Russell Irvine, NAVTRASYSCEN, Orlando, FL, Mr. Richard D. Leavitt, Computer Science Corporation, Orlando, FL, and Captain Michael Pontius, US Army PM TRADE, Orlando, FL, for their participation in Operational Test #1 and the Longitudinal Test.

Dr. Dennis C. Hribar, Mr. Phillip L. Stuckemeyer, and Mr. D. L. Stokes, Newport News Shipbuilding Co., Newport News, VA, for their participation in Operational Test #2.

Dr. John Lett, Mr. Al Scott and Ms. Sabine Atwell, DLIFLC, Monterey, CA, for their participation in Operational Test #3.
EXECUTIVE SUMMARY

PROBLEM

The Automated Simulator Test and Assessment Routine (ASTAR) is an automated decision aid designed to assist a training system analyst to predict the effectiveness of a training device during its development (Rose, Martin & Wheaton, 1988). ASTAR was developed to provide a systematic and analytic evaluation procedure to aid training device design and acquisition. Prior to implementation as a standard evaluation technique, it was necessary to conduct field tests with operational analysts to determine user acceptance of ASTAR.

OBJECTIVE

The objective was to demonstrate the operational utility of ASTAR and formulate a plan to implement ASTAR as a standard evaluation technique within the DoD Instructional System Development (ISD) process.

APPROACH

The operational evaluation was accomplished through a series of integrated tests using operational training systems and their analysts. The tests assessed the operational utility and impact of ASTAR on existing and new training systems. A single test could not adequately or efficiently address the scope of the evaluation criteria required to assess the operational utility of ASTAR. Therefore, several tests were conducted during the course of this project, including three operational tests and a longitudinal test. These tests examined performance, utility, and user issues with regard to ASTAR.

CONCLUSIONS

While the concept of ASTAR was well received by the operational analysts, the current implementation of ASTAR achieved poor user acceptance. ASTAR will require extensive enhancement before it can gain general user acceptance. A functional description for an improved ASTAR was developed which addressed the problems in ASTAR. It is recommended that any further developmental action on ASTAR be limited to consideration of the design specified in the ASTAR Functional Description included in this report, or a totally new effort to develop a technique for estimating training effectiveness.

SPECIAL REPORT 90-004

INTRODUCTION

ASTAR is a computer-based decision aid developed by the American Institutes for Research (AIR) under contract to the government. It was designed to training device during its development (Rose, Martin & Wheaton, 1988). ASTAR was developed to provide a systematic and analytic evaluation procedure to aid training device design and acquisition.

ASTAR is intended to provide training system designers and developers with various kinds of information about the potential effectiveness of a training-device-based system. ASTAR is not designed to produce a single 'Figure of Merit.' The approach to effectiveness analysis is to provide a framework in which device developers can compare devices for effectiveness and diagnose potential problems in a system design. (Rose, Martin & Wheaton, p. 6, 1988)

OBJECTIVE

ASTAR has been the object of an extended development and evaluation process. The final phase of the ASTAR development process was to conduct "field testing" in order to demonstrate the operational utility of ASTAR. The objective was demonstrate the operational utility of ASTAR and formulate a plan to implement ASTAR as a standard evaluation technique within the DoD Instructional System Development (ISD) process.

ORGANIZATION OF REPORT

This report provides brief summaries of the approach, results, and recommendations associated with the ASTAR Operational Evaluation. The results section addresses the utility of the ASTAR concept and the utility of the current program. The section summarizing the recommendations discusses the assessment of the Project Advisory Group (PAG), user recommendations, and implementation recommendations. The appendix documents the functional description for an improved ASTAR program. The appendix includes a number of annexes which provide detailed supporting data.
METHOD

The operational evaluation was accomplished through a series of integrated tests which utilized operational training systems and their analysts. The tests assessed the operational utility and impact of ASTAR on existing and new training systems. A single test could not adequately or efficiently address the scope of the evaluation criteria required to assess operational utility of a program such as ASTAR. Therefore, several tests were conducted during the course of this project, including three operational tests and a longitudinal test. These tests examined performance, utility, and user issues with regard to ASTAR.

The three operational tests involved a structured evaluation of ASTAR using analysts from NAVTRASYSCEN, the US Army Project Manager for Training Devices (PM TRADE), the Defense Language Institute Foreign Language Center (DLIFLC), Newport News Shipbuilding, and Computer Science Corporation. A minimum of three analysts were used for each training system evaluated. When possible, the subjects selected for research were the actual analysts involved in the original development of the selected training systems. User attitudes of the computerized decision aids were evaluated at the completion of each test.

The focus of the longitudinal test was to evaluate opinions of analysts who had used ASTAR over an extended period of time. The test was by nature unstructured and emphasized lessons learned.
RESULTS

UTILITY OF THE ASTAR CONCEPT

Intuitive observation indicates that a need exits for DETs in the procurement of effective training devices. To empirically determine if a need exists within the user community a survey was conducted (Bradley, 1990). Unless the potential user community believes that they need these DETs, any implementation plan for ASTAR will not be effective.

The survey was distributed through government organizations and conferences to 183 potential users, with 46% of the surveys returned. The respondents were asked to indicate whether they had a definite need, a possible need, or no need at all for ASTAR. Overall, there was a definite dichotomy of responses. The majority of respondents were either highly interested in ASTAR or expressed no interest at all. The returned surveys indicated that 52.5% of the respondents had a positive interest in ASTAR.

During the operational tests, the analysts expressed a number of positive opinions concerning the utility of the ASTAR concept. The aspects which analysts liked most included:

a. The overall concept of an automated system to perform training effectiveness evaluations of multiple training devices was considered quite worthwhile. It was felt that the use of such a technique could result in cost, time, and manpower savings.

b. Having a tool to provide quantitative data which can be used in the decision making process during the design and development of training systems.

c. Computer documentation of trainer and weapon system hardware, controls and displays, and operator tasks on IBM compatible software.

d. The structured group approach to training device design that ASTAR requires.

The availability of a DET like ASTAR for use in evaluation of training effectiveness in different emerging devices was seen as a valuable tool for the design of training systems. For example, the ability to conduct ASTAR evaluations at three different levels of device development was felt to be of particular benefit. The analysts believed that the proper application of ASTAR should result in considerable savings in time, cost, and man hours during the ISD process.

THE CURRENT ASTAR PROGRAM IS NOT USEFUL

However, the current version of ASTAR was not perceived by analysts as useful. The poor user acceptance was a function of
the ASTAR user interface. Negative aspects of ASTAR cited by analysts included:

a. Considerable criticism of the output data, or ASTAR results, as presented in the final summary. It was felt that the lack of definition of the data rendered them meaningless. The general tenor of the comments indicated that the subjects did not know what the data were telling them, and there were no documents or screen presentations to tell them how to interpret the different scores.

b. The tediousness and length of time associated with the entry of almost identical lists of controls and displays. This was believed to be unnecessary, redundant, and inefficient.

c. The lack of organization of the menus prohibited a free flow in and out of the process. In other words, there was no capability to escape from the program at any point and then return at a later time to the same point. The user was forced to work through a time consuming and complex procedure to arrive at a point of interest.

CONCLUSIONS

The following conclusions were drawn from the operational test of ASTAR:

- The lack of user friendliness caused a low rating in terms of user acceptance.

- The users considered the concept of ASTAR to be worthwhile but because of user interface problems the subjects would not want to use ASTAR in its current state. They would prefer to use their current methods of training system design.

- The subjects felt that the proper application of ASTAR would result in considerable savings in time, cost, and man hours during the analysis phases of training development.

- Most of the shortcomings can be alleviated by modifying the programs to incorporate current software practices, data base techniques, and user interface standards. ASTAR will require modification before implementation as a standard evaluation technique.

- ASTAR makes no allowances for the impact of training scenario/training materials in its evaluations. These factors are critical determinants of training effectiveness.

In summary, ASTAR is a relatively old program. It was developed before many of the recent advancements in the design and technology of both software and human/computer interfaces. ASTAR will require extensive enhancement before it can gain general user acceptance.
PROJECT ADVISORY GROUP ASSESSMENT

The Project Advisory Group (PAG) met to review the results of the evaluation. The PAG reviewed:

- a summary of the evaluation tests;
- the PAG Assessment Objectives of ASTAR impact, cost, and development time; and
- the recommended Functional Description.

The conclusions of the PAG were mixed. While the concept and underlying benefit of ASTAR were recognized, the current state of the software overshadowed any benefit to be derived by recommending that ASTAR be distributed or institutionalized. While a significant number of users requested access to it, and its use suggests significant inputs to the operational designs, users' reports show they do not value ASTAR in its present software configuration. ASTAR was perceived to be inadequate as it stands. The comments of the PAG were unanimous in suggesting a new start to incorporate the "concept", "approach", or "philosophy" of ASTAR into an improved software package.

USER RECOMMENDATIONS

During the operational tests, the analysts provided a number of suggestions and recommendations for changes to the ASTAR program to improve user acceptance. These comments formed the basis of the functional description for a revised ASTAR, called ASTAR II, contained in the appendix. User recommendations were:

a. ASTAR should be programmed to make it more user friendly and to provide a more meaningful output, e.g. graphics outputs.

b. ASTAR should be programmed to provide:

   (1) Simplified utility menus to allow easy editing, addition, and deletion of controls and displays, and task and subtask data.
   (2) A way to save data on both hard drive and floppy disks.
   (3) Provide input/output capabilities from database and spreadsheet programs;
   (4) Allow revision of data base;
   (5) Allow input to be duplicated;
   (6) Upgrade to mouse input; and
   (7) Allow side-by-side comparison of two systems rather than the current practice of producing analyses for one system at a time.

ASTAR II: THE RECOMMENDED APPROACH

It is recommended that any further developmental action on
ASTAR should incorporate the design specified in the ASTAR Functional Description, or a totally new effort to develop a DET for estimating training effectiveness. The functional description for ASTAR II is the minimal response to the problem areas identified in this evaluation. It would provide a design approach which would satisfy user demands for a modern aid to device development. Once developed and tested, ASTAR II could provide that acceptable assessment routine suitable for integration and acceptance as an industry standard.

ASTAR SUPPORT OF THE INTERSERVICE PROCEDURE FOR INSTRUCTIONAL SYSTEM DEVELOPMENT (IPISD) PROCESS

A useful implementation of an improved ASTAR would be to incorporate the ASTAR evaluation technique into the IPISD. The IPISD is a systems engineering approach to training, which consists of a structured series of analytical steps that break down a weapon system's operational, maintenance, and support requirements into specific tasks, activities, skills, and knowledge. IPISD considers the relative need and appropriate method to train each task, task element, skill, and knowledge to a target student population. Using an iterative building block approach, IPISD determines the training system design requirements for the weapon system. The measures of ASTAR's usefulness must come from successful integration into the procurement cycle. Since IPISD is the approved technique and procedure to be followed in the development and conduct of effectiveness training, it is within this framework that ASTAR must exhibit its worth.

ASTAR II may be useful in three of five IPISD phases. ASTAR will work effectively in four out of the five blocks of the Analyze phase: Select Task/Functions, Construct Performance Measures, Analyze Existing Courses, and Select Instructional Settings. Phase II of the IPISD process, Design, provides much of the qualitative data needed for conducting ratings in the three ASTAR analysis levels. Two of the four blocks within this phase, Develop Objectives and Describe Entry Behavior, provide information to ASTAR. In Phase III, Develop, ASTAR can be used during the Review Existing Materials and Develop Instruction blocks. It is within Phase III that ASTAR makes a direct contribution to the ISD process. Phases IV and V of the IPISD process, Implement and Control, do not relate directly to known uses of the ASTAR technique.

The following summarizes some of the major areas within the IPISD process where ASTAR could be used to assist the training device designer, and where IPISD outputs could be utilized as data inputs to ASTAR:

I. ASTAR uses within IPISD:
   a. Examine training effectiveness of existing materials.
   b. Structure development of training objectives.
   c. Document procedures and major decisions derived.
      1. Document the rationale used in the exclusion and
inclusion of the media alternatives.

2. Document the rationale on a task by task basis by which existing courses are excluded from consideration.

d. Support development of device scripts.
   1. Develop task level device configurations for scripts.
   2. Develop specific control and display configurations.

e. Iteratively examine alternative tradeoff solutions.

II. Data input provided by IPISD:
   a. Edited task lists.
   b. Performance level expected from training.
   c. Knowledge levels and skills necessary.
   d. Entry characteristics of the trainee.
   e. Material, procedures, plans, and media necessary to conduct instruction.

Operational analysts involved in DoD ISD activities have expressed a desire for a DET encompassing the concept of training effectiveness prediction within ASTAR. Furthermore, an ASTAR type of DET would provide a valuable tool within the IPISD. However, the current implementation of ASTAR can not meet this need because of poor user acceptance. To achieve user acceptance, ASTAR would, at a minimum, need to be improved to meet the modifications described in the appendix.

SECTION 1. GENERAL

1.1 PURPOSE OF FUNCTIONAL DESCRIPTION

This Functional Description for the enhancement of the Automated Simulator Test and Assessment Routine (ASTAR) is written to provide:

a. The reprogramming requirements that must be satisfied to enhance the functionality, user friendliness, and user acceptance of the system. This will serve to increase the level of user acceptance.

b. Information on performance requirements, suggested redesign and user impacts.

This Functional Description was developed to meet the format and content requirements of Data Item Description DI-E-30104B.

1.2 PROJECT REFERENCES

This section provides a general summary of ASTAR's approach and the identification of project sponsor, target users, and operating centers where the improved ASTAR program will be used. Additionally, a list of references which are applicable to the history and development of the ASTAR training device design aid is provided.

The ASTAR is an automated decision aid designed to assist an analyst in evaluating the effectiveness of a training device or method. ASTAR uses generally accepted training principles to evaluate the effectiveness of any training method that involves practice on job tasks. ASTAR helps the analyst evaluate a training approach by asking questions about the learning difficulty or transfer of training to the job environment. ASTAR then converts the judgments provided by the analyst about various facets of the training system into a forecast of the system's effectiveness. The analyst responds to a series of questions by assigning the training device under evaluation a subjective rating with a value of between zero and one hundred. This value represents the analysts' perceptions of the effectiveness of the training device on a percentage basis.

The history of ASTAR began in the late 1970s as a manual analysis technique developed by the American Institutes for Research (AIR) for the U. S. Army Research Institute (ARI). Around 1980, AIR was contracted to convert the manual technique to a computer based decision aid. The initial version of the program was sponsored by the ARI and was called the Device Effectiveness Forecasting Technique (DEFT). Early in the 1980s the program was picked up by the Naval Training Systems Center (NAVTRASYSCEP). Around this time the name of the program was changed from DEFT to ASTAR.
The ASTAR and DEFT programs were subjected to a series of development and validation tests during the early to mid 1980s. ASTAR was applied to several systems in various stages of the acquisition process to determine its effectiveness as a decision aid. During these tests, conducted by AIR under contract to NAVTRASYSCEN, ASTAR was demonstrated to have a positive impact on the design process. ASTAR recommendations influenced the final design selection in the Precision Gunnery Trainer System (PGTS) and Combat Talon II Maintenance Trainer programs. Validity statistics were also established during several validation tests conducted in conjunction with NAVTRASYSCEN. These validity statistics, summarized by Rose, Martin and Wheaton (1988) in "Forecasting Training System Effectiveness: Review and Analysis of ASTAR. Final Report" are provided below.

1). A split-plot factorial ANOVA indicated that pretraining in Device 11G2 significantly reduced the amount of time to repair (TTR) malfunctions in the Phalanx ($p < .01$) with the effect being greater for more difficult tasks and for certain subsystems (although interaction effects were not statistically significant). Estimated transfer ratio (TR) ranged from .00 to .63 with an average of .33, where

$$TR = \frac{TTR \text{ (in 11G2)} - TTR \text{ (in Phalanx)}}{TTR \text{ (Historical Data)}}$$

(Rose, Martin & Wheaton, 1988, p. 11)

2). The ASTAR scale values for each factor were averaged (e.g., scales 1+ 5/2) to create three variables for predicting transfer ratios. These averages were compared to the empirically derived transfer ratio for each task using a regression analysis ($N = 16$). The resulting multiple correlation ($r = .64$) was described as expressing the goodness of fit between the modeled ASTAR data and the actual performance data. (Rose, Martin & Wheaton, 1988, p. 12)

3). The transfer coefficients developed from ASTAR, FORTE, and field data were correlated two at a time to provide estimates of concurrent and convergent validity. Convergent validity of ASTAR and FORTE was estimated at $r = .81$ to .99 with a mean of .92. Concurrent validity of ASTAR prediction of transfer was estimated at $r = .45$ to .63 with a mean of .55. (Rose, Martin & Wheaton, 1988, p. 18)

The original validation tests were limited because analyses were predominantly conducted by the developer of the ASTAR, The American Institutes for Research (AIR). In 1989, the University of Central Florida Institute for Simulation and Training
(UCF/IST) was placed under contract by NAVTRASYSCEN to conduct an operational field test of ASTAR. The objective of this evaluation was to determine whether operational analysts could learn and effectively use ASTAR. During the course of the evaluation it was determined that a number of problems existed in the current implementation of the program. The problems did not center on the concepts underlying ASTAR. Instead they were associated with the ease of use and user interface of ASTAR. Current software and human computer interface technology have progressed significantly since the effort to computerize ASTAR was initiated. Hence, user expectations of how the program should operate, based on the current state-of-the-art software, lead to the conclusion that ASTAR could not be implemented in its current form. This functional description addresses the changes that are needed to revise ASTAR to meet current software and interface standards and gain user acceptance. The recommended changes are based on the series of operational tests conducted by UCF/IST.

The intention of the ASTAR program is to develop a training effectiveness prediction decision support aid which could be implemented as a DoD standard analysis technique. ASTAR should be applicable to all government organizations and contractors involved in the development of training devices and training programs for the military.

The following list of references document the original development and test of the ASTAR technique and provide additional supporting data to this functional description. The references are organized alphabetically by author and in order of their publication date within author. Also included, are user manuals and other aids which can assist in the operation of ASTAR.

1.2.1 Technical Documentation

1.2.2 User Aids

1.2.3 Programming and Documentation Standards

Documentation should conform with the intent of DoD Manual 7935. Developers are encouraged to use computer based documentation for both documentation and code. This allows documentation to be archived along with the source code, providing better long term access.

The primary program documentation is the source code. Hence, it should be well documented. To the maximum extent possible, programmer documentation should be built into the source code. The following three items are recommended for inclusion in the program documentation.

1. Program Header- This section of the source code identifies the program's purpose and functions, version, related files/libraries needed for compilation or linking, and external file usage.

2. Module (Subroutine) Header - Where practical, each program module should contain a description of the module's function and methodology, description of the passed parameters, description of common blocks, and
calls by information.

3. A list of modifications made since the previous baseline.

A Software Development Folder should be established at the beginning of the program. All information concerning the development of the program should be included in the software development folder. The software development folder should also include the test plan and test results for the program. If practical, computer copies of the test input and output should be maintained with the source code. The software development folder provides an audit trail for the development and operational verification of the program.

1.2.3.2 Programming Conventions. The following practices are recommended:

Modular coding - Small single function modules are the biggest contributor to good program development.

Extensive use of internal documentation - This includes the module header information, as well as liberally applied in-line comments.

Off-the-Shelf Routines - To the extent possible available off-the-shelf routines should be used.

While ADA has been adopted as the DoD Standard Programming Language, it is recommended that this effort utilize the C programming language. The reasons for this recommendation are:

1. ASTAR is essentially a data base management system. ADA is not well suited to this type of application.

2. The availability of off-the-shelf C modules could be utilized to accomplish ASTAR functions thereby reducing development cost and time.

3. Most of the programs that ASTAR might be used in conjunction with, for import or export of data, are written in C. Therefore, use of the C programming language provides a common programming environment.

1.2.3.3 DoD and other Standards. The development of the improved ASTAR should meet the intent of DoD-STD-2167A, Defense System Software Development, and DoD-STD-2168, Defense System Software Quality Program. These standards should be tailored to meet the objectives of the ASTAR project. Tailoring shall follow the guidance of MIL-HDBK-287, Tailoring Guide to 2167A, and MIL-HDBK-286, Tailoring Guide to 2168.

The interface development of the improved ASTAR should comply with the guidelines in Section 5.15, User-Computer Interface, of MIL-STD-1472D, Human Engineering Design Criteria

1.2.3.4 User Documentation. Computer-based user documentation is strongly recommended. Not only is this form of documentation much easier to maintain, but in many cases, it is much easier to distribute. The user documentation should include the following information:

1. Where possible, discussion of program assumptions and limitations. This should include limits imposed by dimensioning and memory allocation.

2. Complete description of all user inputs and outputs.

3. List of all error messages, including recommended user actions.

4. Sample data sets and examples.

1.3 TERMS AND ABBREVIATIONS

This section provides a listing of terms, definitions and acronyms which are unique to this document. The list should provide users with a handy reference when these terms are encountered.

a. Acquisition Efficiency — the quality of training provided by the training device.

b. ASTAR — Automated Simulator Test and Assessment Routine.

c. DEFT — Device Effectiveness Forecasting Technique.

d. Transfer Efficiency — how well a training device promotes transfer of training to the operating equipment.

e. Transfer Problem — the deficiencies trainees have with respect to operational criterion.

f. Training Problem — the skill and knowledge deficiencies of trainees relative to criterion performance on a training device.

h. Commonality Analysis — the ASTAR process in which common tasks between a training device and the operational system are identified.
i. Similarity Analysis -- the ASTAR process in which the common displays and controls for the training device and operational system are identified.
SECTION 2. SYSTEM SUMMARY

2.1 BACKGROUND

The primary goal of training system design methodologies is to produce training systems which maximize training effectiveness within the limitations of the acquisition process. Because of time and resource constraints inherent in the development of training systems many decisions regarding system design are based on analytic information rather than on empirical data from training system evaluations. There are few formalized techniques for analytic evaluations of training systems. As a result, design decisions are often based on the developer's best judgment. The ASTAR technique was developed to address the need for a systematic, analytical evaluation procedure for application during the training device design and development process.

ASTAR is a direct extension of an earlier procedure known as the DEFT. ASTAR is based on a multidimensional view of training system effectiveness that looks at the global training effort. It considers the trainee population capabilities and limitations, and stated training and performance objectives. It then determines how well the entire training system will promote the acquisition of the skills and knowledge required for proficiency on both the training device and operational hardware. This perspective is in contrast to other training effectiveness models that focus exclusively on transfer of training as the sole criterion of effectiveness. ASTAR examines not only what is trained, but also how well the device-based system is designed to promote effective and efficient training and transfer.

This functional description describes a redesign of ASTAR for the purpose of significantly improving the user friendliness. The redesign of ASTAR is based on user feedback gathered during the course of operational evaluation (Gibbons, Bird, and Companion, 1990; Companion & Bailey, 1990; Bradley and Companion, 1990; Gibbons & Companion, 1990). Hereafter in this document the improved ASTAR will be referred to as ASTAR II. The redesign will be structured to require fewer repetitive tasks and permit more flexibility in the entry and editing of data. It is expected that ASTAR II will be able to import or export data with the joint services ISD/LSAR DSS and have the ability to import data from standard data bases or word processing programs. This improvement in user friendliness should result in increased user acceptance and usability.

2.2 OBJECTIVES

ASTAR has been designed to forecast the effectiveness of device-based training systems. It has the ability to evaluate alternative design concepts for a training device in the early stages of acquisition or investigate which of several utilization patterns is most effective for an existing device. It compares the effectiveness of two training devices that are designed to
train the same tasks or evaluate the effectiveness of differing device configurations. New device based training system designs can be compared with training on the actual equipment or against existing training systems.

The ASTAR II will provide decision support to the training system designer, and will permit more efficient analyses of alternate training approaches to enhance system design. The improved decision support and data management features will allow the training system analyst to work more productively. The new ASTAR II is expected to increase the usability and user acceptance over the current implementation method.

2.3 EXISTING METHODS AND PROCEDURES

The ASTAR is an automated decision aid designed to assist an analyst in evaluating the relative effectiveness of training devices or methods. ASTAR uses generally accepted training principles to evaluate the effectiveness of any training method that involves practice on job tasks. ASTAR helps the analyst evaluate a training approach by asking questions about the learning difficulty or transfer of training to the job environment. ASTAR then converts the judgments provided by the analyst about various facets of the training system into a forecast of the system's effectiveness. The analyst responds to a series of questions by assigning the training device under evaluation a subjective rating with a value of between zero and one hundred. This value represents the analysts' perceptions of the effectiveness of the training device on a percentage basis.

Using the analyst's ratings, ASTAR computes several "effectiveness" scores which can be used to make comparisons among devices or methods. An "Acquisition Effectiveness" score and a "Transfer Effectiveness" score provide a basis for comparisons of what is learned on the device and what remains to be learned on the job. These scores can be combined to provide a summary score of Training Effectiveness.

Figure 1 depicts the data flow through ASTAR from data acquisition through its processing and eventual output.

2.3.1 Equipment Utilized

ASTAR is an interactive, menu-driven program written to run on an IBM PC, XT, AT, PS\2 or 100% compatible microcomputer equipped with either dual disk drives or a hard disk and one floppy disk drive. The ASTAR programs are contained on one floppy disk. Also required is a second formatted floppy disk on which to input the data base and ratings unique to the training systems being evaluated.

2.3.2 Operation Sequence

Figure 2 presents a overview of the operational flow of the current implementation of ASTAR, Version 2.0. It depicts the
Figure 1. Diagram of current ASTAR data flow.
Figure 2. Overview of operation flow in current ASTAR implementation.
interdependencies between the various ASTAR levels as they relate to the creation of the ASTAR data base. Detailed flow diagrams and the source code for the current version of ASTAR are provided in Annexes 2 and 3 respectively. The following paragraphs explain the sequence in which the operational functions are performed.

ASTAR begins operation by asking the user to execute the "BUILD" command. The BUILD command creates a directory on the data disk under the device name specified. Once this set of device files, created by the BUILD command, is constructed ASTAR will not allow the user to BUILD using the same device name. Once the directory containing the device files is established, program start up procedures can be initiated.

Once the decision is made of which ASTAR level of analysis is to be conducted, the data base management sequence is initiated. Building the ASTAR data base requires the entry of data into the ASTAR system, which in turn provides the basis for the effectiveness evaluation. The amount and level of detail of data required for imputing is dependent on the level of analysis to be conducted.

ASTAR Level 1 utilizes general ratings from the analyst without building a data base of tasks and subtasks as required for ASTAR Levels 2 and 3. The decision of which level to use depends upon the amount of information that the analyst has about the training device/method, the operational equipment and performance, the tasks to be trained, and the trainees themselves.

After completion of the data base maintenance routines, ASTAR ratings are performed; this task requires the user to assign a rating value to a series of questions. The number and kind of judgments the analyst must make vary as a function of the level of analysis that is chosen, i.e. Level 1 requires eight judgments, Level 2 requires 13 judgments per task, and Level 3 requires 35 different ratings for each task in the data base. Once all ratings are made, an evaluation summary screen is displayed.

The analyst is required to interpret ASTAR results in accordance with the unique training objectives of the evaluation. ASTAR provides a Summary of Results Table. Summary results are structured around the four basic components of ASTAR: the training problem, the acquisition efficiency, the transfer problem, and the transfer efficiency. This completes the operational flow from data acquisition through its processing and system outputs; the user now exits the ASTAR program.

2.3.3 Deficiencies

Deficiencies in the existing ASTAR system were determined from subjects' responses during three operational tests and a longitudinal test (Gibbons, Bird, and Companion, 1990; Companion
Most deficiencies were noted in the area of user friendliness. A summary of the deficiencies in the current version of ASTAR is provided in Annex 1. Specific shortcomings cited by the users are as follows:

a. There exists no input/output capabilities for interfacing with other data base, word processing or spreadsheet programs.

b. Many desirable editing functions are absent or difficult to accomplish, i.e. adding, deleting, and revising task, control, and display data.

c. There is no capability for side-by-side comparison of two or more systems; the current procedure gives output sequentially from one trainer to the next.

d. The final ASTAR results summary screen is unclear. It lacks definition and has no documentation or screen helps to explain how to interpret the scores.

e. It is time consuming and redundant to enter almost identical lists of controls and displays and task lists for both the operational system and the training device.

f. Menu organization prevents easy access in and out of the ASTAR process. There is no capability to escape during program operations and return to that same point at a later time. Presently a lengthy and complex procedure must be followed, which is in itself variable depending on the location of the reenter point.

g. There is no capability to save data on both hard drive and floppy disks.

h. There is no mouse interface.

i. There are no graphics capabilities included for ASTAR outputs.

j. Trainer cost factors are not included in the ASTAR evaluation.

k. There is no capability to enter ratings for all training devices under consideration in parallel. The current system requires the user to run through the entire ASTAR routine one device at a time.

2.3.4 Computational Formulas

Table 1 presents the basic algorithms employed in ASTAR. These computational formulas represent the equations used directly in the ASTAR Level 1 computations. The ASTAR Level 2

formulas are functionally identical, but are composite averages across the ratings within each of the eight subject categories, where applicable, and across tasks or subtasks (see Table 2). In the ASTAR Level 3 formulas, Table 3, the ratings are also averaged across each common control and display within the functional and physical similarity categories. These formulas are greatly simplified. The details of the computational formulas can be derived from the ASTAR flow diagrams in Annex 4 and the ASTAR 2.0 source code listings in Annex 2.

2.4 PROPOSED METHODS AND PROCEDURES

The main purpose of the redesign effort is not to change the functionality of ASTAR, but rather to increase the user friendliness. ASTAR II will still be an automated decision aid designed to assist an analyst in evaluating the effectiveness of a training device or method. The ASTAR II continues to help the analyst evaluate a training approach by asking questions about the learning difficulty or transfer of training to the job environment. The program converts the judgments provided by the analyst about various facets of the training system into a forecast of the system's effectiveness. The analyst will respond to the same series of questions, assigning the training device under evaluation a subjective rating with a value of between zero and one hundred. This value will represent the analysts' perceptions of the effectiveness of the training device on a percentage basis.

ASTAR II will have the same functional capabilities. It will use the analyst's ratings to compute "effectiveness" scores which can be used to make comparisons among devices or methods. An "Acquisition Effectiveness" score and a "Transfer Effectiveness" score will still provide a basis for comparisons of what is learned on the device and what remains to be learned on the job. The algorithms employed in the determination of these scores will remain unchanged (see Tables 1, 2 and 3). The structure of the ASTAR II program will permit easy modification of computational formulas if desired by configuration control.

Additionally ASTAR II will have the capability of interfacing with conventional off the shelf data bases and word processors capable of producing ASCII code. A method of interfacing with the existing data structures of the ISD/LSAR DSS will also be provided.

ASTAR II will continue to be an interactive, menu-driven program designed to run on an IBM PC, XT, AT, and PS/2 Personal Computer or 100% compatibles.

2.4.1 Operation Sequence

The operational sequence for the ASTAR II is illustrated in the top level functional flow diagram depicted in Figure 3. ASTAR II is designed to provide a flexible flow through the program. Upon entering the ASTAR program, by typing "ASTAR"

$t = \text{task or subtask number}$

$q = \text{question number}$
TABLE 3
ASTAR III COMPUTATIONAL FORMULAS

NOTE: These equations are simplified. See Appendices for details.

Performance Deficit: Performance Deficit Rating \( R_{1 \text{tn}} \) = \( R_1 \) for \( t = 1 \) to \( n \)

Learning Difficulty: Learning Difficulty Rating \( R_{2 \text{tn}} \) = \( \sum_{t=1}^{n} R_2 \) for \( t = 1 \) to \( n \)

Training Problem: \[ \sum_{t=1}^{n} \left( R_{1 \text{tn}} \times R_{2 \text{tn}} \right) / 100 - (S1) \]

Quality of Training - Acquisition: Training Acquisition Rating \( R_{3 \text{tn}} \) = \( \sum_{t=1}^{n} R_3 \) for \( t = 1 \) to \( n \)

Acquisition - Efficiency: \[ \sqrt[100]{\left( R_{3 \text{tn}} \right)} / (S2) \]

Acquisition: \[ (S1) / (S2) - (T1) \]

Residual Deficit: Residual Deficit Rating \( R_{4 \text{tn}} \) = \( R_4 \) for \( t = 1 \) to \( n \)

Residual Learning Difficulty: Residual Learning Difficulty Rating \( R_{5 \text{tn}} \) = \( \sum_{t=1}^{n} R_5 \) for \( t = 1 \) to \( n \)

Physical Similarity: Physical Similarity Rating \( R_{6 \text{t}} \) = \( \sum_{t=1}^{n} \sum_{s=1}^{m} \sum_{h=1}^{p} \sum_{f=1}^{q} R_6 / (N1) \times (N0) \)

Functional Similarity: Functional Similarity Rating \( R_{7 \text{t}} \) = \( \sum_{t=1}^{n} \sum_{s=1}^{m} \sum_{h=1}^{p} \sum_{f=1}^{q} R_7 / (N1) \times (N0) \times (N0) \times (N0) \)

Transfer Problem: \[ \left[ \sum_{t=1}^{n} \left( \left( R_{4 \text{tn}} \right) \times R_{5 \text{tn}} \right) / 100 \right] \times (R_6 - R_7) - (S3) \]

Quality of Training - Transfer: Training Transfer Rating \( R_{8 \text{tn}} \) = \( \sum_{t=1}^{n} R_{8 \text{tn}} \) for \( t = 1 \) to \( n \)

Transfer Efficiency: \[ \sqrt[100]{R_{8 \text{tn}}} / (S4) \]

Transfer: \[ (S3) / (S4) - (T2) \]

Sum: \[ (T1) + (T2) \]

\( t = \) task or subtask number
\( q = \) question number
Figure 3. Operational Flow for ASTAR II.
<ENTER>, ASTAR II will take you to the main menu. At the same time the on-line help and audit trail facilities will be automatically activated. These two facilities remain active until ASTAR II is exited. If ASTAR II determines that this is floppy disk or hard disk. The ASTAR II manual can be printed as an option within the installation routine. After the installation it will automatically go into the set up utility where the user specifies monitor, printer and other relevant set up parameters. After the set up is completed the program will transition to the main menu.

ASTAR II provides a number of selections from the main menu. Menu selections include: conduct file operations; conduct an ASTAR Level 1, 2, or 3 analysis; or exit ASTAR II. Infrequent operations can be accessed via function keys rather than main menu selections. Function keys available on the main menu provide access to: help screens; the on-line tutorial; the set up routine; DOS; results analysis; and to a directory of existing data bases. Section 4.1.2 presents a discussion of all function key assignments. When ASTAR II enters the main menu, the "conduct analysis selections" are inactive. They become active only when a system name has been specified and ASTAR II determines that an associated data base exists. If ASTAR II determines that a data base does not exist for that system, it will automatically transition to the file operations menu. If ASTAR II determines that a data base does exist for the system, then it activates all main menu and function key options.

The File Operations function encompasses the ASTAR II data base management utilities. A data base must be established prior to conducting any ASTAR II analysis. The file operation utilities permit a data based to be created or modified. Data bases may be created either through an internal data base program or by importing files from other modules. Other utilities provided under the file operation function include: exporting data; deleting and copying files; and printing reports.

The ASTAR II analysis function parallels the current ASTAR implementation. This function permits ASTAR II Level 1, 2 or 3 ratings to be input into the data base. The rating procedure is the same as for the current implementation of ASTAR. The primary functional difference is that ASTAR II permits multiple systems to be rated simultaneously. At the subfunction level, ASTAR II also provides extensive branching so that the program may be entered or exited randomly rather than in a sequential mode without data corruption. Upon entering the ratings, ASTAR II provides access to the analysis results. The results summaries are a subfunction of the ASTAR II analysis function.

The basic functional flow within ASTAR II is similar to the current implementation of ASTAR, but all functions are now internal to the main program. The build function is a separate program in the current ASTAR. Section 4.0 provides a detailed description of the operational sequence for ASTAR II.
2.4.2 Summary of Improvements

The following sections provide a summary of the improvement incorporate in the design of the ASTAR II. Each of the described areas responds to deficiencies identified during the operational tests conducted as part of the ASTAR Operational Evaluation.

2.4.2.1 Programming. The programming environment for ASTAR II will be the C programming language. This will provide a flexible software environment that should support the improved functionality summarized below. The use of the C programming language will also provide a reduced development time because of the availability of off-the-shelf routines. These routines should be used wherever possible; specifically for data base development, data import/export utilities, and graphic output routines.

2.4.2.2 Functionality. In the area of functionality, ASTAR II will exhibit the same baseline functionality present in the original ASTAR. The revision will reorganize the basic operation of all of the ASTAR functions and also improve the effectiveness of many baseline functions. New areas of functionality will include the following:

- import/export data base routines,
- on-line helps,
- hard copy outputs,
- graphics capability,
- the ability to evaluate multiple devices simultaneously,
- broader hardware capability,
- and a recommended on-line tutorial.

ASTAR II will upgrade the following ASTAR capabilities:

- internal data base routines
- user interface, and
- add a number of evaluation output options.

2.4.2.3 Compatibility. ASTAR II will be compatible with other software. It will retain its own internal data base development and management routine and also be able to import and export data to programs such as the joint services ISD/LSAR DSS and other standard data bases and word processors capable of generating and accepting ASCII code.

2.4.2.4 User Configuration. ASTAR II will be based on a single user configuration which provides a utility to merge and combine the ratings from different files (analysts). A system which automatically combines the ratings of multiple users, rating the identical training device design, would be more efficient for the method of group analysis employed by the present ASTAR system. This multiple user system is elegant but potentially increases the hardware requirements. Thus, an intermediate configuration based on the single user, but which provides a utility to merge
and combine ratings from different files (analysts), is proposed.

2.4.2.5 Help Options. ASTAR II will include a number of additional help features designed to provide the analyst with complete information required to complete an analysis. On-line help in the form of simple text messages will be accessible at critical instances of operation. Computational helps will provide information about the ASTAR equations; this is intended to help increase user understanding and acceptance. Assistance will be available when making ratings, i.e., providing additional anchor point examples. Query routines will be established which allow the user to access ratings from related questions or from a different ASTAR II analysis level. Prompts which clearly identify the source and type of errors will also be provided.

2.4.2.6 Data Base Management. The internal data base management function will include a utility module to handle the setup of the data base structure and configure the data base file formats. The list entry procedures for tasks, controls and displays will be upgraded and simplified. New data base management routines will provide a number of additional features. For example, data entry and editing routines will allow users to exit and move around freely within the system without disrupting the program, i.e., random access permitted. An automated replication procedure for control and display lists for each task will be provided. Non-appropriate controls and displays will be deleted by mouse or cursor highlighting within ASTAR II.

External data base management will provide an import/export capability to any source that can provide ASCII format information. Specific interfaces will be provided to ISD/LSAR DDS, standard word processing, spread sheets and other common data bases. The imported data must be modifiable so that as the ISD progresses and more data becomes available, data can be integrated into the imported file without having to recreate the entire file. Data items available in the ISD/LSAR DDS which correspond with ASTAR information requirements are as follows:

- weapon system name,
- subsystem name if applicable,
- task name,
- task ISD code,
- task element name (subtask),
- task element number (subtask),
- skill/knowledge name and number,
- and task criticality.

Use of text editors and word processors for the creation of data files or modifications of the data base items will be possible. This form of input will require a template to specify the correct data structure and format.

2.4.2.7 Ratings Entry. ASTAR II will permit ratings for multiple training devices to be entered on the same screen; permitting anchoring or reference across systems and removing the
repetitive aspects of the current model. Also a function key will be available to enter the same rating for all devices if appropriate.

ASTAR II will provide a consistent method of data entry. The <SHIFT-TAB> will be active and permit transition between data fields of multiple device designs. A standard three digit default value will be assigned to data fields. The <ENTER> command will signal that the data fields for the devices have been completed, and that the next query screen question to be answered is accessed.

2.4.2.8 Outputs. The number and types of ASTAR outputs will be increased, and existing outputs enhanced to provide more useful information to the user. The outputs will be available on screen, printer or disk. Screen based outputs will include: ratings; tabular scores; and graphics. The display of ratings made on tasks and subtasks will be available to the user in both tabular and graphic formats. Display of both summary task and subtask scores will be available in tabular and graphic formats of each measured parameter. All sub-scores presently available in ASTAR Level 1 will be included in Levels 2 and 3 analyses. Graphical output of scores will be available in the form of bar graphs and line charts. It would be desirable to have 3-D outputs available to provide for better visualization of problems.

The following outputs will be available via hard copy printouts: all ASTAR graphics and tabular outputs; task lists; and controls and display lists. Through a menu of print options the user will be able to print out an individual chart, a subset of charts, or a total output data package. Disk based outputs will be available for all ASTAR tabular outputs discussed above. A file structure will make available, as disk outputs, these reports and results for importing into documents or exporting to other programs such as the ISD/LSAR DSS.

2.4.2.9 User Interfaces. The user interface, cited as the major deficiency of the ASTAR program, will be significantly modified during this functional redesign effort. The user interface will be structured require fewer repetitive tasks and provide flexible data entry and data management procedures. The interface will be menu driven and use cursor, mouse, and key letter strokes to select menu options. The interface of the ISD/LSAR DSS will be used as general guidance for the new ASTAR II integration. Key features design of the ASTAR II interface which will correct the deficiencies cited in Section 2.3.3. A summary list of these features is provided below:

a. On-line help;

b. Random access entry and exit;

c. Multiple system evaluations;
d. One time entry of task, control, and display lists;
e. On-screen task, control, and display list editing;
f. On-screen, cursor driven commonality and similarity matching;
g. Overall reduced keying requirements;
h. Data import and export capability;
i. Selection and deselection of tasks, controls, displays, etc. by mouse; and
j. Conduct of ASTAR II commonality and similarity analysis matching using a mouse.

2.4.2.10 Computational Formulas. Computational formulas will be available to the user in a read only manner. The ASTAR II program will be structured so that the computational formulas can be updated as new information becomes available. However, modification will be by DoD configuration control only. The computational formulas present in ASTAR will not be changed in ASTAR II. However, where necessary, basic subscores not currently computed in ASTAR Level 3 will be added.

2.4.2.11 Set up. A set up module will allow each user to specify the display configuration, number of analysts, data paths, etc. This will be used by the ASTAR II program to familiarize itself with the hardware configurations present in the host environment. It will also permit additional control of the analysis to be placed directly into the user's hands.

2.4.2.12 User Training. Existing training manuals will be updated and provided off line to the users. A desirable option available in the new system will be the addition of an on-line tutorial, supplemented by a disk based "read me" file which would provide supplemental hard copy material. The program would be self-contained on disk with no more than a single sheet of overview and installation procedures. All required training material and help features will be contained in the program as accessible hard copy printouts.

2.4.3 Summary of Impacts

The anticipated impacts of the ASTAR II system are discussed in the following sections.

2.4.3.1 User Organization Impacts. There are no organizational impacts anticipated. ASTAR has not been fielded as a standard tool and thus a change in its presentation format does not effect any existing organization.

2.4.3.2 User Operational Impacts. User operational impact will be minimal in terms of operational procedure changes. ASTAR
II should permit an easy transition from current procedures. The new features in ASTAR II are designed to minimize the operational impact by making ASTAR II user friendly. No new data requirements will be imposed by ASTAR II. ASTAR II should facilitate data retention because it is computer based.

2.4.3.3 User Development Impacts. There will be minimal user development impact in terms of effort required prior to implementation of the revised system. Training in the application of the technique will still be required. There will be changes in training content to accommodate new and revised procedures. The preferred method of training will be through an on-line tutorial, supplemented by a user's manual and general classroom training as necessary.

2.5 ASSUMPTIONS AND CONSTRAINTS

Two primary assumptions are associated with the development of ASTAR II: (1) government and contractor personnel who are engaged in training effectiveness evaluations will have access to microcomputer systems capable of hosting ASTAR II; and (2) the potential user population possesses some degree of computer literacy.
THIS PAGE INTENTIONALLY LEFT BLANK
SECTION 3. DETAILED CHARACTERISTICS

3.1 PERFORMANCE REQUIREMENTS
The following paragraphs describe the performance goals and requirements for the ASTAR II program.

3.1.1 Accuracy and Validity

The primary accuracy requirements for ASTAR II concern the computational algorithms. The calculations for ASTAR II must be accurate to two decimal places, i.e., rounding occurs based on the third decimal point. The accuracy requirements for data input into ASTAR II are primarily a function of the user. The user shall be able to review and modify data as needed. The program must accept the keyed data without error. Data imported into ASTAR II is primarily text-based information. This type of information must be imported with at least 98% accuracy. The exception is for the importing of rating data during a merge routine. In this case, transmission accuracy must be 100%.

3.2 Timing

The timing within ASTAR II will vary as a function of the host hardware and the module. The basic timing requirements will comply with MIL-STD-1472C. These timing values will apply for a 80286 or higher microprocessor. For 8088 and 8086 microprocessor, the timing delay for queries shall not exceed 5 seconds. The output timing should not exceed 10 seconds from output request to presentation of output summary in either graphic or tabular format.

3.2 FUNCTIONAL AREA SYSTEM FUNCTIONS

There are nine major functional areas within ASTAR II. These functions were depicted previously in Figure 3. The following paragraphs describe the characteristics of each major function.

3.2.1 Installation

This function installs ASTAR II on either a floppy disk or hard disk drive as specified by the user. During the installation routine the user is given the option to print out a hard copy of the users manual, which is stored on the distribution disk.

3.2.2 Set Up

The set up function permits the user to specify the hardware configuration of the system ASTAR II is installed on. The user can select or change the monitor and printer configuration. The user also specifies whether a mouse is present in the system. Another subfunction that is recommended for ASTAR II and should be selected by the user through the set up utility is an automatic save feature, which will save all data in memory to
disk every fifteen minutes.

3.2.3 Select Option

The select option is the main menu function for ASTAR II. From the main menu, the user may select the level of ASTAR II analysis, select file operations or exit ASTAR II. Other subfunctions are provided via function keys. Subfunctions accessible through function keys are:

- the help routines,
- the on-line tutorial,
- the set up utility,
- jump to the view results routine,
- view a directory of existing data bases,
- escape to DOS and return, and
- quit.

3.2.4 File Operations

The file operation function is the data base creation and management function. Through this function the user creates a data base structure; sets the number of devices; names of the devices for evaluation; accesses data import and export utilities; merges data bases from multiple raters; copies and deletes data bases; manages the data base, which includes conducting similarity and commonality analyses; and requests reports of the data to be printed.

3.2.5 ASTAR II Analysis

The ASTAR II analysis function has two primary components; the rating subfunction and the results/output subfunction. The rating subfunction is used to assign ratings for each device based on ASTAR II evaluation categories. The number of ratings that are assigned is determined by the level of ASTAR II analysis. The results/output subfunction permits the user to view the results of the ASTAR II analysis. This subfunction permits the user to examine both raw data and ASTAR II assessments. ASTAR II assessments may access both summary and subscores to aid in interpretation. The results may be viewed in appropriate tabular or graphic formats.

3.2.6 On-line Help

The on-line help utility provides context dependent help at all points within ASTAR II. This function resides on-line while ASTAR II is active. It is always accessed by pressing the F1 function key. The on-line help provides brief text messages to clarify the operation of keys, option, or information relevant to the interpretation of ASTAR II scores.

3.2.7 Audit Trail Log

The audit trail log maintains a continuous time and date
tagged log of operations conducted on an ASTAR II data base. It logs day of creation, dates accessed, operations conducted, analyses conducted, notes if the data base was created by merging files, etc. This function should not be readily accessible to the user. The only access currently specified is a printout capability provided as part of the file operations report function.

3.2.8 On-Line Tutorial

The on-line tutorial is the primary training vehicle for ASTAR II. It is accessed through a function key on the main ASTAR II menu. It provides an interactive tutorial which describes and leads the user through exercises using ASTAR II.

3.2.9 Quit ASTAR

The quit function lets the user exit ASTAR II. The Quit function saves and closes all files as appropriate and downloads any memory resident routines. It also serves to deactivate and close the on-line help and audit trail log.

3.3 INPUTS - OUTPUTS

The following section describes each data element in the data inputs to and outputs from ASTAR II. Samples of suggested ASTAR II output formats are provided in Annex 6.

3.3.1 Inputs

1. Data Element Name: Task Number

   Definition: User assigned number identifying a unique task or subtask

   Format: #.#

   Input Medium: Keyboard, Disk

   Range of Values: 1.0 - 25.25

   Unit of Measurement: N/A

   Data Item Names: Task, Subtask

   Miscellaneous: When tasks/subtasks are imported from other programs, the range of values and number of levels may exceed the above specification. The import routine will need to permit the task numbers to be edited and/or automatically renumbered in the ASTAR II format. Only a maximum of four levels will be permitted after editing. ASTAR II will parse the data so that Level 1 task numbers, 1.0, 2.0, etc., will be treated as tasks, Level 2 task numbers, 1.1, 10.4, etc., will be treated as subtasks, Level 3 task numbers, 1.1.1, 3.2.6, etc., will be reidentified as A-35
skills, and Level 4 task numbers, 1.3.5.6, etc., will be reidentified as knowledge.

2. Data Element Name: Task Name
   Input Medium: Keyboard, Disk
   Definition: Text label describing the task
   Format: Text String
   Range of Values: 1 to 50
   Unit of Measurement: Character
   Data Item Names: N/A
   Miscellaneous: See miscellaneous under task number

3. Data Element Name: Control Name
   Definition: Text description of device control
   Input Medium: Keyboard, Disk
   Format: Text
   Range of Values: 1 to 50
   Unit of Measurement: Character
   Data Item Names: N/A

4. Data Element Name: Display Name
   Definition: Text description of device display
   Input Medium: Keyboard, Disk
   Format: Text
   Range of Values: 1 to 50
   Unit of Measurement: Character
   Data Item Names: N/A

5. Data Element Name: Skill
   Definition: Text description of skill to be trained
   Input Medium: Keyboard, Disk
   Format: Text
Range of Values: 1 to 50
Unit of Measurement: Character
Data Item Names: N/A

Miscellaneous: When the task list is imported from another program, any subtask at the level three task number, e.g., 1.2.3, will be relabeled a skill.

6. Data Element Name: Knowledge
Definition: Text description of knowledge to be acquired
Input Medium: Keyboard, Disk
Format: Text
Range of Values: 1 to 50
Unit of Measurement: Character
Data Item Names: N/A

Miscellaneous: When the task list is imported from another program, any subtask at the level four task number, e.g., 1.2.3.4, will be relabeled a knowledge.

7. Data Element Name: Rating
Definition: User assigned rating to each device based on ASTAR II questions
Input Medium: Keyboard, Disk
Format: ###
Range of Values: 0 to 100, default (no rating) = -999.
On data items with a range of 0 - 100, a 0 rating is assigned an internal value of 1.
Unit of Measurement: digit

3  Quality of Trng - Trans  7  0 - 100
3  Quality of Trng - Trans  8  0 - 100

Miscellaneous: For ASTAR Level 2, ratings for each data item are made on a task and subtask basis (for those tasks and subtasks matched on the commonality analysis). For ASTAR Level 3, ratings for each data item are made on a task and subtask basis (for those tasks and subtasks matched on
the commonality analysis). For ASTAR Level 3, ratings for physical similarity are also made for those controls and displays matched during the similarity analysis.

8. **Data Element Name**: Device Name

   **Definition**: Text label for training device or operational system

   **Input Medium**: Keyboard, Disk

   **Format**: Text

   **Range of Values**: 1 to 20 devices
   1 to 50 characters per name

   **Unit of Measurement**: Character

   **Data Item Names**: N/A

3.3.2 Output

1. **Data Element Name**: Task List

   **Output Medium**: Screen, Disk, Printer

   **Definition**: List of tasks ordered by task/subtask number

   **Format**: #.# Text

   **Range of Values**: 0 - 50

   **Unit of Measurement**: N/A

   **Data Item Names**: Task Number, Task Name

   **Miscellaneous**: N/A

2. **Data Element Name**: Control List

   **Output Medium**: Screen, Disk, Printer

   **Definition**: List of controls ordered by control number

   **Format**: C# Text

   **Range of Values**: 0 - 200

   **Unit of Measurement**: N/A

   **Data Item Names**: Control Number, Control Name

   **Miscellaneous**: N/A
3. Data Element Name: Display List
   Output Medium: Screen, Disk, Printer
   Definition: List of displays ordered by display number
   Format: D# Text
   Range of Values: 0 - 200
   Unit of Measurement: N/A
   Data Item Names: Display Number, Display Name
   Miscellaneous: N/A

4. Data Element Name: Skill List
   Output Medium: Screen, Disk, Printer
   Definition: List of skills ordered by skill number
   Format: S# Text
   Range of Values: 0 - 200
   Unit of Measurement: N/A
   Data Item Names: Skill Number, Skill Name
   Miscellaneous: N/A

5. Data Element Name: Knowledge List
   Output Medium: Screen, Disk, Printer
   Definition: List of knowledge items ordered by knowledge item number
   Format: K# Text
   Range of Values: 0 - 200
   Unit of Measurement: N/A
   Data Item Names: Knowledge Number, Knowledge Name
   Miscellaneous: N/A

6. Data Element Name: Ratings
   Output Medium: Screen, Printer
   Definition: Ratings assigned to each device based on ASTAR II questions
Format: ###, graphic

Range of Values: 0 - 100. For data items with a rating range of 0 - 100 a rating of 0 is assigned a value of 1.

Unit of Measurement: N/A

**Miscellaneous:** For ASTAR II Level 2, ratings for each data item are made on a task and subtask basis (for those tasks and subtasks matched on the commonality analysis). For ASTAR II Level 3, ratings for each data item are made on a task and subtask basis (for those tasks and subtasks matched on the commonality analysis). For ASTAR II Level 3, ratings for physical similarity are also made for those controls and displays matched during the similarity analysis.

**Numeric (tabular) outputs may be device (within or across devices) by ASTAR II level by data item, or device by ASTAR II level by data item question. Output may be average across tasks or subtasks, or for individual tasks or subtasks.**

**Graphic outputs may be device (within or across devices) by ASTAR II level by data item, or device by ASTAR II level by data item question averaged across tasks or subtasks. For individual tasks or subtasks, graphic outputs may be within a device for ASTAR II level by data item, or ASTAR II level by data item question. For individual tasks to subtasks, graphic outputs across devices may be for ASTAR II level, a range of tasks or subtasks, data items or data item questions.**

7. **Data Element Name:** Analysis Scores

**Output Medium:** Screen, Disk, Printer

**Definition:** Computed scores and summary scores derived from ratings by ASTAR computational formulas

**Format:** Numeric, Tabular Numeric, Graphic

**Range of Values:** See Data Item Names:

**Unit of Measurement:** N/A

Miscellaneous: Output grouping can vary widely depending on user selected options. Tabular outputs may be across devices or for a single device. They may be at either the task or subtask level, and may be within a single level of ASTAR II analysis or across levels. They may also include all of the data items listed above or a specified subset. [Note: performance deficit, learning difficulty, residual deficit, and residual learning difficulty are not available as subscores in an ASTAR II Level 3 analysis.] The default tabular format is:

Performance Deficit
Learning Difficulty
Training Problem
Quality of Training - Acquisition
Acquisition Efficiency
Acquisition
Residual Deficit
Residual Learning Difficulty
Physical Similarity
Functional Similarity
Transfer Problem
Quality of Training - Transfer
Transfer Efficiency
Transfer
Sum

Graphic outputs may only be displayed across devices within an ASTAR II level. Graphic outputs for a single device must be across ASTAR II levels. They may be at either the task or subtask level. They may also include all of the data items listed above or a specified subset. [Note: performance deficit, learning difficulty, residual deficit, and residual learning difficulty are not available as subscores in an ASTAR II Level 3 analysis.]
8. Data Element Name: Device Name

Output Medium: Screen, Disk, Printer

Definition: Label for Training Device or Operational System

Format: Text

Range of Values: 1 - 20 devices
1 - 50 characters per device

Unit of Measurement: N/A

Data Item Names: Training Device, Operational System

Miscellaneous: N/A

9. Data Element Name: Audit Trail Log

Output Medium: Printer

Definition: A time and date tagged listing of operations conducted within an ASTAR II data base.

Format: Text

Range of Values: TBD

Unit of Measurement: N/A

Data Item Names: N/A

Miscellaneous: N/A

3.4 DATA BASE CHARACTERISTICS

All data items described in section 3.3.1, Inputs, will be used in the ASTAR II data base. In addition to these externally entered items, ASTAR II will internally generate several items to be included in the data base. The internally generated items are identified below.

1. Data Element Name: Control Number

Definition: Internally generated sequential number assigned to control names

Input Medium: Internal

Format: "C"#

Range of Values: 1 to 200

Unit of Measurement: N/A
Data Item Names: N/A

2. Data Element Name: Display Number
   Definition: Internally generated sequential number assigned to display names
   Input Medium: Internal
   Format: "D"#
   Range of Values: 1 to 200
   Unit of Measurement: N/A
   Data Item Names: N/A
   Data Item Names: N/A
   Data Item Names: N/A

3. Data Element Name: Skill Number
   Definition: Internally generated sequential number assigned to skill items
   Input Medium: Internal
   Format: "S"#
   Range of Values: 1 to 200
   Unit of Measurement: N/A
   Data Item Names: N/A

4. Data Element Name: Knowledge
   Definition: Internally generated sequential number assigned to knowledge items
   Input Medium: Internal
   Format: "K"#
   Range of Values: 1 to 200
   Unit of Measurement: N/A
   Data Item Names: N/A
   Data Item Names: N/A
   Miscellaneous:
5. Data Element Name: Audit Trail Log

Definition: A time and date tagged listing of operations conducted within an ASTAR data base.

Input Medium: Internal

Format: Test

Range of Values: TBD (maximum size of file)

Unit of Measurement: N/A

Data Item Names: Date, Time, ASTAR II operations

6. Data Element Name: Analysis Scores

Definition: Computed scores and summary scores derived from ratings by ASTAR II computational formulas

Input Medium: Internal

Format: Numeric (specific format depends on data item)

Range of Values: See Data Item Names:

Unit of Measurement: N/A

Data Item Names:

3.5 FAILURE CONTINGENCIES

Backup disks of the ASTAR II software and data bases should be kept available in the unlikely event of a software failure. A hardware failure can be overcome by using another IBM or IBM compatible PC. If both software and system hardware failures are encountered, users would be instructed to return to manual methods.
3.6 SECURITY

ASTAR II itself will require no special security provisions. However, in some instances, classified task, control and display information might be entered into the ASTAR II data base. In such instances, normal national security regulations regarding "need to know" and levels of user clearance would prevail. The highest, most restrictive level of classification would be applied to the ASTAR disk holding the classified data base.

If data is exported to another program, such as ISD/LSAR DSS, special provisions should be observed. To maintain the integrity of the data base, it is important that the importing of data be limited to those users of an appropriate level of responsibility.
SECTION 4. DESIGN DETAILS

The section of the functional description provides a description of the ASTAR II system and identifies the ASTAR II system functions. A demonstration disk of the ASTAR II user interface is attached to the inside back cover of this document. This demonstration disk illustrates the ASTAR screen formats and flow of functions. A set of hard copy printouts of the ASTAR II screens shown in the demonstration disk is provided in Annex 5.

4.1 SYSTEM DESCRIPTION

4.1.1 System Functional Features

The following paragraphs summarize the design features of ASTAR II. As applicable, the design features address the comments, suggestions and problems with the current ASTAR that were derived during the various operational tests. A summary of these comments is provided in Annex 1. Following each design feature, the item(s) in Annex 1 addressed by that feature are identified by number(s). A demonstration disk of the ASTAR II user interface is provided with the final version of the Functional Description.

4.1.1.1 Programming Environment. ASTAR II should be programmed in C. This provides a flexible software environment which should support the functionality envisioned for ASTAR II. The utilization of C also provides a reduced development time because of the availability of off-the-shelf C routines. Off-the-shelf routines should be used wherever possible; specifically for data base development, data import/export utilities, and graphic output routines.

4.1.1.2 Compatibility. ASTAR II should be data compatible to other data bases, word processors, spreadsheets, ISD/LSAR DSS, etc. (3)

The recommendation is for ASTAR II to be data compatible with other software. ASTAR II should retain an internal data base development and management routine, but it should also be able to import and export data to other programs. The ASTAR II should be able to import data from standard data bases, word processors or spreadsheets. Standard word processors could be used as editors during the import/export of data. This option requires specification of a template for the ASTAR data base. ASTAR should also be able to import/export data to the joint services ISD/LSAR DSS. Initially, this would require passing data in ASCII format.

4.1.1.3 User Configuration. ASTAR II should be a single user system. To accommodate multiple analysts ASTAR II will provide a utility to merge and combine the ratings from different files or analysts. (1,5)
4.1.1.4 Help. ASTAR II will include a number of new help features as described in the following paragraphs.

4.1.1.4.1 On Line Help. The ASTAR II will incorporate on-line facilities. They should be simple text messages. They will be context dependent as appropriate. (10,11)

4.1.1.4.2 Computational Formula Help. The help information will provide information about the ASTAR II computational formulas to aid the user in interpreting the ASTAR II analyses. (9)

4.1.1.4.3 Rating Help.
- Examples: The help function will provide additional examples and/or examples of anchor points for the rating scales. (2)
- Query: The help will include a query routine which permits the user to access ratings from related questions or a different level of ASTAR II analysis, skills and knowledge lists, or other data. (35)
- Monitoring: The help routine will monitor the ratings for ASTAR II Levels 2 and 3 and compare the average for each index to the ASTAR II Level 1 ratings. Large discrepancies (TBD %) between the ratings will be flagged to the user. (28,34,35)

4.1.1.4.4 Prompts. Error prompts will conform to current standards for human computer interface design. Error messages will identify the source/type of error. (27,36)

4.1.1.5 Data Base. The data base is one of the key areas identified for enhancement within ASTAR II. There will be both internal data base capability and the ability to import data from external sources.

4.1.1.5.1 Internal Data Base Management.
- Utilities: A utility will be available within the internal data base module. The utilities should handle the setup of the data base structure and configure the data base file formats. The functions should include:
  - name file and devices
  - specify number of devices to be included
  - data path
  - merge ratings from multiple analysts
  - copy and delete files (2,4,5)
Features: The internal data base will provide both data entry and data editing capability. The data base will provide list entry capabilities for tasks, controls, displays, skills and knowledge (the last two are optional data items). The tasks should be matched using mouse or cursor highlighting. Controls and display list will be replicated under each task automatically and non-appropriate controls and displays deleted. Control and display matching will be by mouse or cursor highlighting. Both the data entry and editing routines will permit random access, i.e., enter/exit and move around freely within the system without disrupting the program. (1,2,4,5,6,13,23,30)

4.1.1.5.2 External Data Base Management.

- Interfaces: Import/export capability will be provided to any source which can provide ASCII format information. Specific interfaces should be provided to ISD/LSAR DSS, standard word processing, spreadsheets and other common data bases. The word processors could be used as an editor for import of data from external sources. It should be possible to designate portions of the task list for ASTAR II analysis. A renumbering routine to be more compatible with ASTAR II formats will be provided. (3)

- ILS/LSAR DSS. Several items should be accessible from the ILS/LSAR DSS. These include:

  - weapon system name
  - subsystem name if applicable
  - task name
  - task ISD code (task number)
  - task element name (subtask)
  - task element number (subtask)
  - skill/knowledge number
  - skill/knowledge name
(40)

The imported data must be modifiable so that as the ISD process progresses and more data becomes available it can be integrated into the imported file without having to recreate the entire file. This also is required as you progress from ASTAR II Level 1 to ASTAR II Level 3.
- Other Sources: Text editors, i.e., word processors, should be usable for the creation of data files or the modification of data from data bases. This form of input will require a template to specify the correct data structure/format.

4.1.1.6 Entry of Ratings.

4.1.1.6.1 Multiple Systems. ASTAR II will permit ratings for each training device to be entered on the same screen. This permits reference or anchoring across systems and removes the repetitive aspects of the current system. A function key should be available to enter the same rating for all training devices if appropriate. (7)

4.1.1.6.2 Query. ASTAR II will permit on-line query of ratings on related questions or a different level of ASTAR II. It is desirable to provide the ASTAR II Level 1 ratings automatically as a reference. (35)

4.1.1.6.3 Consistent Entry. ASTAR will provide a consistent method of entry. The <ENTER> command will be used when all entries have been made on the page. The TAB key should be used to shift between the data field for each training device. The <SHIFT-TAB> should also be active to permit transition between data fields in either direction. A standard 3 digit default value should be assigned to each field until data is actually entered. (12)

4.1.1.7 Outputs. The outputs from ASTAR should be available on screen, by printer or on disk.

4.1.1.7.1 Screen Based Outputs. An enhanced set of screen based outputs will be available within ASTAR II. The outputs should include both tabular and graphic formats.

- Ratings: Display of the ratings on a task and subtask basis should be available to the user. These ratings should be available in either tabular or graphic format. (12,37,38,39)

- ASTAR II Scores: Display of both summary and subtask scores will be available to the user. The scores will be available by task or subtask and by performance category in either tabular or graphic format. All sub scores available in ASTAR II Level 1 will be available for Levels 2 and 3, if available. (12,37,38,39)

- Graphic Outputs: Graphic outputs of scores should be available in the form of bar graph or line charts. It
is desirable for 3-D outputs to be available to provide for visualization of problems. 3-D graphics provide significantly improved outputs over 2-D graphics. (8,12,37,38,39)

4.1.1.7.2 Printer Based Outputs. All ASTAR II outputs, both graphics and tabular will be available in hard copy format. Hard copy of the tasks, control, display, skill, knowledge lists will be available. It will also be possible to obtain hard copy of the rating information and the audit trail log. The user should be able to print out an individual chart, a subset of charts, or a total data output package.

4.1.1.7.3 Disk Based Outputs. All ASTAR II tabular outputs should be available as disk outputs, either floppy or hard disk. The disk based outputs would be used to import the results into documents or export to other programs such as ILS/LSAR DSS. (14)

4.1.1.8 User Interface. The user interface will be significantly modified to improve the user friendliness of ASTAR II. The design will be structured to provide less repetitive tasks and permit more flexible and editable data entry. The interface will be menu driven using either cursor or mouse selection.

Key features of the interface will include:

- on line help
- random access entry/exit
- multiple system evaluations
- one time entry of task list
- on screen task list editing
- on screen, cursor driven commonality/similarity matching
- overall reduced keying requirements
- data import/export
- function key access
(1,3,5,6,7,8,11,12,13,25,26,27,28,33,34,35,36)

Several advanced features should be examined as part of the design effort. These features include a flow diagram type of menu interface with "click-on" direct access to various ASTAR II functions: commonality and similarity analysis matching by mouse selections of items; selection/deselection of tasks by mouse; and query of 3-D graphs by mouse.

4.1.1.9 Computational Formulas.

4.1.1.9.1 Availability of Formulas. The computational formulas should be available to the user in a "read only" manner. (9)

4.1.1.9.2 Modifiability of Formulas. The program should be structured so that the computational formulas can be updated as new information becomes available, but modification will be by the DoD configuration control only.
4.1.1.9.3 Display of Contributions. The contribution of the various indexes within the formulas will be computed and displayed to the user. (9,37,38)

4.1.1.10 Setup. A set up module should be provided which can be used to specify the display configuration, printer, data paths, etc.

4.1.1.11 Training Materials. The training materials will be provided in the form of manuals and as an on-line tutorial. The manual will be delivered on the distribution disk and printed out during the installation routine. The program will be self-contained on disk with no more than a single sheet of overview and installation instructions. (29,21,32)

4.1.2 Function Key Assignments

ASTAR II will utilize function keys to access operations and access utilities. The function keys utilities are designed to make the user interface more flexible and informative. The active function keys for each screen will be displayed on the bottom two lines of the display. Table 4 summarizes the function key assignments for ASTAR II. It identifies the operations assigned to each key. The function numbers refer to the functional flow numbering scheme described in Section 4.2. A brief description of the function key operations is provided below.

<table>
<thead>

4.2 SYSTEM FUNCTIONS

The following section delineates the functions and subfunctions within ASTAR II. A description of the top level functions is provided, accompanied by a functional flow diagram depicting subfunction breakdown and the sequencing of operations. Detailed functional flow diagrams are provided as necessary to illustrate the functional operation of ASTAR II. The level of detail to which the functional flow diagrams are developed reflects the complexity within the function or subfunction. The functional flow diagrams are developed to the minimum level of detail required to describe the basic functionality within ASTAR II. Figure 4 identifies the symbology utilized in the development of the functional flow diagrams.

4.2.1 Functional Descriptions

4.2.1.1 Top Level Functional Description. The top level functional flow diagram illustrates the overall design of ASTAR
Figure 4. Functional Flow Diagram Symbology.
Top Level ASTAR II
II. There are nine top level functions in the ASTAR design as described below. (Function 1.0 is a decision to install ASTAR II and is not described below.)

2.0 **Installation**
This function installs ASTAR II on either a floppy disk or hard disk as specified by the user. During the installation routine, the user is given the option to print out a hard copy of the user's manual, which is stored on the distribution disk.

3.0 **Select Option**
The select option is the main menu function for ASTAR II. From the main menu, the user may select the level of ASTAR subfunctions are provided via function keys. Sub-functions accessible through function keys are:

- the help routines,
- the on-line tutorial,
- the set up utility,
- jump to the view results routine,
- view a directory of existing data bases,
- escape to DOS and return, and
- quit.

4.0 **Set Up**
The set up function permits the user to specify the hardware configuration of the system ASTAR II is installed on. The user can select or change the monitor and printer configuration. The user also specifies whether a mouse is present in the system. Another subfunction that is provided in ASTAR II, selectable through the set up utility, is an automatic save feature. This feature will save all data in memory to disk every fifteen minutes.

5.0 **ASTAR II Analysis**
The ASTAR II analysis function has two primary components: the rating subfunction and the results/output subfunction. The rating subfunction is used to assign ratings for each device based on ASTAR II evaluation categories. The number of ratings that are assigned is determined by the level of ASTAR II analysis. The results/output subfunction permits the user to view the results of the ASTAR II analysis. This subfunction permits the user to examine both raw data and ASTAR II assessments. ASTAR assessments may access both summary and subscores to aid in interpretation. The results may be viewed in either a tabular or graphic format as appropriate.

6.0 **File Operations**
The file operation function is the data base creation and management function. Through this function the user creates a data base structure; sets the number of devices; names the devices for evaluation; accesses data import and export utilities; merges data bases from multiple raters; copies
and deletes databases; manages the database, which includes conducting similarity and commonality analyses; and requests reports of the data.

7.0 **Quit ASTAR II**
The quit function lets the user exit ASTAR II. It saves and closes all files as appropriate and downloads any memory resident routines. It also serves to deactivate and close the on-line help and audit trail log.

8.0 **On-line Help**
The on-line help utility provides context dependent help at all points within ASTAR II. This function resides on-line while ASTAR is active. It is always accessed by pressing the F1 function key. The on-line help provides brief text messages to clarify the operation of keys, options, or information relevant to the interpretation of ASTAR scores.

9.0 **Audit Trail Log**
The audit trail log maintains a continuous time and date tagged log of operations conducted on an ASTAR II database. It logs day of creation, dates accessed, operations conducted, analyses conducted, notes if the data base was created by merging files, etc. This function should not be readily accessible to the user. The only access currently specified is a printout capability provided as part of the report function under file operations.

10.0 **On-Line Tutorial**
The on-line tutorial is the primary training vehicle for ASTAR II. It is accessed through a function key on the main ASTAR II menu. It provides an interactive tutorial which describes and leads the user through exercises using ASTAR II.

4.2.1.2 **ASTAR II Functional Flow Diagrams.** The following functional flow diagrams provide a more detailed breakdown of the top level functions described above. The level of breakdown varies across function and subfunction sufficient to depict the full functionality with ASTAR II. The level of detail beyond that provided involves implementation decisions and will be completed during the ASTAR II development effort.

4.2.2 **Accuracy and Validity**

The requirements for accuracy and validity for data and calculations are as specified in Section 3.1.1.

4.2.3 **Timing**

The ASTAR II requirements for timing are as specified in Section 3.1.2.
Level 2 ASTAR II

4.3 **FLEXIBILITY**

Two areas within ASTAR II require flexibility in the program development. The first area is the file of ASTAR II questions. The three levels of ASTAR II questions should remain as independent text files. This permits terminology within questions to be modified for a specific operational environment. These changes should be made by appropriate DoD program personnel to ensure that all users within an operational environment are using an equivalent version of the program. The second area of potential modification is the ASTAR II computational formulas. If new information becomes available which indicates that the formulas could be improved, it should be possible to easily make the necessary changes. This requires the source code for ASTAR II to have adequate internal documentation and be structured so that the equations can be easily updated and verified. Changes to the computational formulas should only be made by personnel within the DoD organization charged with ASTAR II configuration control.

4.4 **SYSTEM DATA**

4.4.1 **Inputs**

The system data inputs are the same as described in Sections 3.1.1 and 3.4.

4.4.2 **Outputs**

The system data outputs are the same as described in Section 3.1.2. Annex 6 provides examples of the different ASTAR II outputs indicating suggested format, headings, etc.

4.4.3 **Data Base**

The data base structure for ASTAR II shall be hierarchical and be comprised of separate smaller data bases for different data classes. An overall data base structure will be established for each system. Under this top level structure, separate smaller data bases will be established for each training device. This permits flexibility in selecting subsets of devices for analysis and editing. Below is a list of the basic data bases needed for ASTAR II.

1. **Title: System Data Base**

   **Definition:** Top level data base that defines the data base structure for a weapons system. It contains information on the number of training devices, the training device names, etc. It will also include the current computed ASTAR scores. The audit trail log may be part of the system data base or a separate data base.
2. Title: Audit Trail Log (may be implemented as part of the system data base)

Definition: A date and time tagged file of ASTAR II operations on a specific system data base. It contains information on the date of creation, source (new or merged), if merged it identifies the source files, operations conducted on each access of the ASTAR II data base, etc.

3. Title: Training Device Rating Data Base

Definition: A numeric and text data base which contains the ASTAR II ratings, for all three levels, for a particular device. This data base also contains the commonality and similarity analysis for the data base training device. These analyses are used to determine the active ratings for ASTAR II Level 2 and 3 analyses as appropriate.

4. Title: Task data base

Definition: A numeric and text file which contains the master list of tasks and subtasks and their associated number. (A master list is the total list of items across all devices prior to editing to create the tailored list applicable to a particular device.)

5. Title: Control data base

Definition: A numeric and text file which contains the master list of device controls and their associated number.

6. Title: Display data base

Definition: A numeric and text file which contains the master list of device displays and their associated number.

7. Title: Skill data base

Definition: A numeric and text file which contains the master list of skill items and their associated number.

8. Title: Knowledge data base

Definition: A numeric and text file which contains the master list of knowledge items and their associated number.

9. Title: Help

Definition: One or more text files to support the on-
line help facility. These files contain help messages, examples, prompts, etc.

10. Title: Error messages

   Definition: Text file which contains a list of the ASTAR II error messages.

11. Title: ASTAR Level 1 questions

   Definition: Text file which contains the questions for an ASTAR Level 1 analysis. Questions are provided in Annex 3.

12. Title: ASTAR Level 2 questions

   Definition: Text file which contains the questions for an ASTAR Level 2 analysis. Questions are provided in Annex 3.

13. Title: ASTAR Level 3 questions

   Definition: Text file which contains the questions for an ASTAR Level 3 analysis. Questions are provided in Annex 3.
SECTION 5. ENVIRONMENT

5.1 EQUIPMENT ENVIRONMENT

The current implementation of ASTAR is designed to run on an IBM PC, XT or 100% compatible, dual floppy disk drives or one floppy drive and one hard drive, monochrome monitor and 256k memory. This hardware environment is insufficient for useful implementation of ASTAR because it does not support more recent common microprocessors or printer outputs. The hardware environment for ASTAR II is outlined below. The hardware environment is compatible with the joint services ISD/LSAR DSS specification. Requirements are as follows:

a. Hardware - - IBM PC, XT, AT, PS/2 or 100% compatibles. A color monitor is recommended but not required; EGA or VGA preferred. A mouse is also recommended although not included in the ISD/LSAR DSS specification.

b. Main Memory - - Hardware should include 640k bytes of RAM.

c. Printer - - Any IBM character graphics set printer with 80 to 256 columns.

d. Storage Capacity - - Sufficient to support the import of data from other programs. Minimum storage recommended is 20 to 30m bytes. (ISD/LSAR DSS requires 65m bytes for a single weapon system.)

5.2 SUPPORT SOFTWARE ENVIRONMENT

The software support environment for ASTAR II is minimal. It is designed to run as a stand alone program operating in a MS-DOS environment with no external software requirements. It can be used in conjunction with other programs capable of producing ASCII data files, e.g., word processors, which are available in the user's work environment. The organization providing configuration control for ASTAR II should have available the C compiler selected for the program. The compiler would only be necessary for recompilation if changes are made to the program, such as modification of the computational formulas.

5.3 INTERFACES

The ASTAR II system should have the capability to interface with word processors, spreadsheets, data base programs or the data base of ISD/LSAR DSS to access task and control and display data. The data exchange format should be in ASCII format. Interface should be by disk or optionally by modem. Such an interface would save considerable duplication of effort and data entry time. The import routine within ASTAR II should provide a template which permits the imported data to be reformatted to meet ASTAR II data base structure and organization.

A-89
5.4 SUMMARY OF IMPACTS

5.4.1 ADP Organization Impacts

There are no ADP organizational impacts anticipated.

5.4.2 ADP Operational Impacts

There are no ADP operational impacts anticipated.

5.4.3 ADP Development Impacts

The personnel and processing commitment necessary to revise and test the ASTAR system will depend on the degree of acceptance of the recommended options and improvements.

5.5 FAILURE CONTINGENCIES

Backup disks of the ASTAR software and data bases should be kept available in the unlikely event of a software failure. A hardware failure can be overcome by using another IBM or IBM compatible PC. If both software and system hardware failures are encountered users would be instructed to return to manual methods.

5.6 SECURITY

ASTAR itself will require no special security provisions. However, in some instances, classified task, control and display information might be entered into the ASTAR data base. In such instances, normal national security regulations regarding "need to know" and levels of user clearance would prevail. The highest, most restrictive level of classification would be applied to the ASTAR disk holding the classified data base.

If data is exported to another program, such as ISD/LSAR DSS, special provisions should be observed. To maintain the integrity of the data base, it is important that importing of data be limited to those users of an appropriate level of responsibility.

5.7 ASSUMPTIONS AND CONSTRAINTS

It is assumed that ASTAR II will be compatible with the range of IBM compatible microcomputers in government and contractor inventory at the time of its development.
SECTION 6. COST FACTORS

This section addresses the cost factors which are associated with the actual development of ASTAR II. Actual cost estimates will be developed as part of the proposal response if the decision is made to develop ASTAR II. The cost factors include:

- Technical Management
- Subject Matter Expertise
- Software Design
- Training Materials
- Software Development
- Documentation
- Reports
- Test and Evaluation
- Travel
- Miscellaneous
- Implementation
SECTION 7. SYSTEM DEVELOPMENT PLAN

The system development plan is TBD. It will be developed by the developer and sponsor of the ASTAR II development effort when pursued.
SECTION 8. ANNEXES

This section provides annexes of supporting data for the ASTAR II development effort. Annex 1 presents a compilation of the comments, ratings and suggestions derived during the operational evaluation which drove the design of ASTAR II. Annex 2 provides the source code for the current implementation of ASTAR. Annex 3 provides a print out of the ASTAR questions. Annex 4 provides detailed flow diagrams and other data for the current implementation of ASTAR. Annexes 2, 3 and 4 are intended to provide background information on the operation of ASTAR. Annex 5 provides hard copy examples of the preliminary screens associated with ASTAR II. Finally, Annex 6 provides samples of ASTAR II output formats.
ANNEX 1

ASTAR COMMENTS/SUGGESTIONS
COMPOSITE ASTAR NEGATIVE COMMENTS, 
BELOW AVERAGE RATINGS AND 
SUGGESTED CHANGES

1. Tediousness and length of time 
   associated with the entry of almost 
   identical lists of controls and displays 
   for both the operational system and the 
   trainer in both the workbook and the 
   computer.

2. Inflexibility of the model once the data 
   is entered

3. Provide input/output capabilities from 
   data base and spreadsheet programs

4. Allow revision of data base

5. Allow input to be duplicated

6. Upgrade to mouse input

7. Allow side-by-side comparison of two 
   systems rather than the current practice 
   of producing output for one system 
   followed by output for the next

8. Offer graphics capabilities

9. The lack of definition of the data in 
   final summary renders it meaningless.

10. Need documents or screen presentations 
    to tell how to interpret the different 
    scores.

11. Lack of organization of the menus which 
    prohibited a free flow in and out of the 
    process. In other words, there was no 
    capability to escape from the program at 
    any point and then return at a later 
    time to the same point. This could be 
    done, of course, but not quickly and 
    conveniently. Instead, the user was 
    forced to work his way through a time 
    consuming, complex procedure to arrive 
    at his point of interest.

12. ASTAR should be reprogrammed to make it 
    more user friendly and to provide a more 
    meaningful output.
13. Simplified utility menus to allow easy editing, addition, and deletion of controls and displays, and task and subtask data

14. A way to save data on both hard drive and floppy disks.

15. Some cost factors be included in ASTAR or costing recommendations made that could be used with the existing ASTAR results

16. Overall utility ASTAR rated 3 on scale of 1 to 3 compared to conventional methods and AIMS. (1=highest, 3=lowest)

17. Overall ease of use ASTAR rated 2.6 on scale of 1 to 3 compared to conventional methods and AIMS. (1=highest, 3=lowest)

18. Overall relevance of ASTAR rated 2.6 on scale of 1 to 3 compared to conventional methods and AIMS. (1=highest, 3=lowest)

19. Overall effectiveness ASTAR rated 2.3 on scale of 1 to 3 compared to conventional methods and AIMS. (1=highest, 3=lowest)

The following ratings were made on a seven point scale. (1 = low, 4 = average, 7 = high)

20. Not Useful/Useful rating of 2.3

21. Difficult/Easy rating of 2.1

22. Frustrating/Satisfying rating of 2.1

23. Rigid/Flexible rating of 2.3

24. Unproductive/Productive rating of 1.8

25. Illogical/Logical organization of menus of 3.6 (2 of 3 rated average or above)

26. Confusing/Very Clear Labels rating of 3.6 (2 of 3 rated above average)

27. Not Helpful/Helpful prompts rating of 3 (2 OF 3 average)

28. Never/Always kept informed rating of 2.6

29. Difficult/Easy learn to operate rating of 2.1
30. Difficult/Easy to explore features rating of 2.3

31. Not Helpful/Helpful instructional materials rating of 2.8

32. Incomplete/Thorough instructional materials rating of 3.3 (1 slightly below average and 1 above average)

33. Never/Always straightforward tasks rating of 3.1

34. Not Helpful/Helpful feedback rating of 3.0

35. High/Low memory requirement rating of 2.8

36. Not Helpful/Helpful error message rating of 1.6

37. Not Useful/Useful analysis results rating of 2.0

38. Difficult/Easy to understand results rating of 1.6

39. Confusing/Clear format of results rating of 2.3

40. Integrate with the Joint Services ILS/LSAR DSS

ANNEX 3
ASTAR QUESTIONS
Examine the training objectives and consider what you know about the typical trainee's background, work experience, and prior training.

What proportion of the skills and knowledge required by the training objectives will the typical trainee have to learn in order to reach criterion performance on the training device?

Enter this proportion using the following scale:

0 10 20 30 40 50 60 70 80 90 100

0 = None - the trainee does not have to learn anything.
100 = All - the trainee has to learn all of the skills and knowledge needed to meet the training objectives.

Consider the skills and knowledge needed to meet the training objectives that the trainee must learn (the Performance Deficit that you identified).

Rate the difficulty the typical trainee will have learning these skills and knowledge using the following scale:

0 10 20 30 40 50 60 70 80 90 100

0 = Very easy - it will take practically no training or practice on the device to learn the skills and knowledge needed to meet the training objectives.
100 = Very difficult - it will take a lot of training or practice on the device to learn the skills and knowledge needed to meet the training objectives.
device to learn the skills and knowledge needed to meet the training objectives.

ZQ03 ******************************************************************************
QUALITY OF TRAINING - ACQUISITION          ASTAR 1

Consider what you know about the training device, a typical instructor (if there is one), the skills and knowledge that the typical trainee must learn, and how the device will be used.

ZQ03 ******************************************************************************
QUALITY OF TRAINING - ACQUISITION          ASTAR 1

To provide good instruction, a training system (the device and the instructor) should:
- tell the trainees what they must learn to do,
- tell the trainees how they are doing in a way that they will understand,
- provide enough practice, and
- provide a record of trainee performance.

Enter one of the following ratings:

0 = the training system does NONE of these things.
25 = the training system does ONE of these things.
50 = the training system does TWO of these things.
75 = the training system does THREE of these things.
100 = the training system does ALL of these things.

ZQ04 ******************************************************************************
RESIDUAL DEFICIT                    ASTAR 1

Assume that the trainees have completed training and are proficient on the training device.

Examine the operational performance objectives. What proportion of the operational skills and knowledge will typical trainees STILL have to learn in order to meet the performance objectives?

Enter this proportion using the following scale:

FMXMMXMM5
0  10  20  30  40  50  60  70  80  90  100
0 = None - the trainees do not have to learn anything else.
100 = All - the trainees have to learn all of the skills and knowledge needed to meet the operational performance objectives.

RESIDUAL LEARNING DIFFICULTY

Consider the skills and knowledge that a graduate of the training device still must learn in order to meet the operational performance objectives (the Residual Deficit that you identified).

Rate the difficulty the typical trainee will have learning these skills and knowledge using the following scale:

<table>
<thead>
<tr>
<th>Scale</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Very easy - it will take practically no training or practice on the operational equipment to learn the skills and knowledge.</td>
</tr>
<tr>
<td>100</td>
<td>Very difficult - it will take a lot of training or practice on the operational equipment to learn the skills and knowledge.</td>
</tr>
</tbody>
</table>

PHYSICAL SIMILARITY

Physical similarity is based on a comparison of the physical characteristics of the training system and the operational system.

Compare the location, appearance, and feel of controls and displays in the training system with the controls and displays in the operational system. Compare the environmental conditions (lighting, temperature, noise levels, etc.) in the training system with the conditions in the operational system.

Rate the physical similarity between the training device and the operational equipment using the following scale:

<table>
<thead>
<tr>
<th>Scale</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Different - the trainee will notice a large difference between the training device and the operational equipment.</td>
</tr>
<tr>
<td>100</td>
<td>Identical - the trainee will not notice any difference between the training device and the operational equipment.</td>
</tr>
</tbody>
</table>
FUNCTIONAL SIMILARITY

Functional similarity is based on how the controls and displays work in the training device and in the operational equipment.

Do the corresponding controls work the same way in the training device and in the operational equipment? Do the corresponding displays show the same information in the training device and in the operational equipment?

FUNCTIONAL SIMILARITY

Rate the functional similarity between the training device and the operational equipment using the following scale:

0 10 20 30 40 50 60 70 80 90 100

0 = Different - all the controls and displays work differently in the training device and in the operational equipment.
100 = Identical - all the controls and displays work the same way in the training device and in the operational equipment.

QUALITY OF TRAINING - TRANSFER

Consider what you know about the training device and operational situation, a typical instructor (if there is one), and how the device will be used.

To provide good transfer, a device should:

- train tasks that are similar to the operational tasks,
- provide training conditions that are similar to the operational conditions, and
- provide extensive practice for difficult tasks.
Enter one of the following ratings:

0 = the training system does NONE of these things.
33 = the training system does ONE of these things.
67 = the training system does TWO of these things.
100 = the training system does ALL of these things.

PERFORMANCE DEFICIT

Examine the training objectives and the description of this task. Consider what you know about the typical trainee's background, work experience, and prior training.

What proportion of the skills and knowledge required to perform this task to criterion in the training device will the typical trainee have to learn?

Enter this proportion using the following scale:

FMXMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMM5
0 10 20 30 40 50 60 70 80 90 100

0 = None - the trainee does not have to learn anything.

100 = All - the trainee has to learn all of the skills and knowledge needed to meet the training objectives for this task.

LEARNING DIFFICULTY

Consider the skills and knowledge needed to meet the training objectives for this task that the trainee must learn (the Performance Deficit that you identified).

Rate the difficulty the typical trainee will have in learning to perform this task using the following scale:

FMXMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMM5
0 10 20 30 40 50 60 70 80 90 100

0 = Very easy - it will take practically no training or practice on the device to learn the skills and knowledge needed to meet the training objectives for this task.
100 = Very difficult - it will take a lot of training or practice on the device to learn the skills and knowledge needed to meet the training objectives for this task.

Consider what you know about the training device, a typical instructor (if there is one), the skills and knowledge that the typical trainee must learn, and how the device will be used.

Rate the training system using the following four scales.

1. For what percentage of the tasks does the training system tell the trainees exactly what they must learn to do?

   0 = None - trainees are not told what they must learn to do for any of the tasks.
   100 = All - trainees are told what they must learn to do for all of the tasks.

2. For what percentage of the tasks does the training system provide enough practice?

   0 = None - practice is not provided on any of the tasks that must be learned.
   100 = All - enough practice is provided on all of the tasks that must be learned.

3. For what percentage of the tasks does the training system tell the trainees how they are doing (provide feedback) in a way that they will understand?
4. For what percentage of the tasks does the training system provide a record of trainee performance?

0 = None - feedback about performance is not provided on any of the tasks that must be learned.

100 = All - feedback about performance is provided on all of the tasks that must be learned.

QUALITY OF TRAINING - ACQUISITION

RESIDUAL DEFICIT

Assume that the trainees have completed training and are proficient on this task in the training device.

Examine the operational performance objectives for this task. What proportion of the skills and knowledge required to perform this operational task will the trainees STILL have to learn?

Enter this proportion using the following scale:

0 = None - the trainees do not have to learn anything else to perform this task.

100 = All - the trainees have to learn all of the skills and knowledge needed to meet the operational performance objectives for this task.

RESIDUAL LEARNING DIFFICULTY

Consider the skills and knowledge that a graduate of the training device
STILL must learn in order to meet the operational performance objectives for this task (the Residual Deficit that you identified).

Rate the difficulty the typical trainee will have learning these skills and knowledge using the following scale:

```
0  10  20  30  40  50  60  70  80  90  100

0 = Very easy - it will take practically no training or practice on the operational equipment to learn the skills and knowledge.

100 = Very difficult - it will take a lot of training or practice on the operational equipment to learn the skills and knowledge.
```

PHYSICAL SIMILARITY ASTAR 2

Physical similarity is based on a comparison of the physical characteristics of the training system and the operational system.

Compare the location, appearance, and feel of controls and displays in the training system with the controls and displays in the operational system. Compare the environmental conditions (lighting, temperature, noise levels, etc.) in the training system with the conditions in the operational system.

PHYSICAL SIMILARITY ASTAR 2

For this task, rate the physical similarity between the training device and the operational equipment using the following scale:

```
0  10  20  30  40  50  60  70  80  90  100

0 = Different - the trainee will notice a large difference between the training and operational equipment for this task.

100 = Identical - the trainee will not notice any difference between the training device and the operational equipment for this task.
```

FUNCTIONAL SIMILARITY ASTAR 2

Functional similarity is based on how the controls and displays work in the training device and in the operational equipment.

Do the corresponding controls work the same way in the training device and in the operational equipment? Do the corresponding displays show the same information in the training device and in the operational equipment?
FUNCTIONAL SIMILARITY

For this task, rate the functional similarity between the training device and the operational equipment using the following scale:

0 = Different - for this task, all the controls and displays work differently in the training device and in the operational equipment.

100 = Identical - for this task, all the controls and displays work the same way in the training device and in the operational equipment.

QUALITY OF TRAINING - TRANSFER

Consider what you know about the training device and operational situation, a typical instructor (if there is one), and how the device will be used.

Considering the training system as a whole, answer the following three questions.

1. What percentage of the tasks that must be learned in the training device are similar to the tasks that are performed in the operational situation?

2. For what percentage of the tasks that must be learned in the training device are the conditions of performance similar to the operational situation?
0 = None - conditions in training are not similar to the operational situation for any of the tasks.

100 = All - conditions in training are similar to the operational situation for all of the tasks.

3. For what percentage of the tasks that must be learned in the training device is an extensive amount of practice given?

0 = None - not even a single task is practiced extensively.

100 = All - every task that trainees must learn in the device is practiced extensively.

ZZ08 ***************************************************************************************
QUALITY OF TRAINING - TRANSFER          ASTAR 2

ZZ09 ***************************************************************************************
ASTAR 2 - EVALUATION SUMMARY

ZZ99 ***************************************************************************************
PERFORMANCE DEFICIT

Examine the training objectives and the description of each training subtask. Consider what you know about the typical trainee's background, work experience, and prior training.

Rate how well the typical trainee will be able to perform each subtask in the training device. Enter your ratings using the following definitions.

Rating  Definition
0 = Cannot perform this subtask.
     Has had no previous training.

1 = Cannot perform this subtask.
     Has had orientation training only.

2 = Can perform this subtask only if assisted in every step.
     Has had familiarization training only.

3 = Can perform this subtask but needs more training.
     Has had procedural training.

4 = Can perform this subtask completely and accurately.
     Has received skill training.

LEARNING DIFFICULTY

Consider the skills and knowledge needed to meet the training objectives for this subtask that the trainee must learn (the Performance Deficit that you identified). Answer the following six questions.

1. Will the trainee use job aids or memory aids to perform this subtask in the training device?
Definition - Job and memory aids assist in doing a subtask correctly. Some examples are:
- Documents (Tech Manuals, etc.),
- Instructions printed on the equipment, and
- Memory joggers (S-A-L-U-T-E).

Enter one of these ratings:

0 = Job or memory aids ARE used
1 = Job or memory aids ARE NOT used.

ZZ02 ******************************************************************************
LEARNING DIFFICULTY                        ASTAR 3

2. How many steps are required to do this subtask?

Definition - A step is a separate physical activity with well defined, observable beginning and end points. A subtask may have one step (identify enemy vehicles) or many steps (those involved in disassembling a rifle).

Enter one of these ratings:

0 = The subtask contains LESS than 10 steps.
1 = The subtask contains MORE than 10 steps.

ZZ02 ******************************************************************************
LEARNING DIFFICULTY                        ASTAR 3

3. Must the trainee perform the steps in this subtask in sequence?

Enter one of these ratings:

0 = The subtask steps DO NOT have to be performed in order.
1 = The subtask steps MUST BE performed in a specific order.

ZZ02 ******************************************************************************
LEARNING DIFFICULTY                        ASTAR 3

4. Does the subtask have a built-in logic so that the trainees know when they are doing it correctly?

Definition - Some subtasks consist of steps that form a logical or natural sequence, like fixing a tire or changing a light bulb. Other subtasks have steps that seem arbitrary, like many troubleshooting subtasks. Some subtasks contain a mixture of "natural" and "unnatural" steps. For example, safety steps often break the natural flow and logic of a subtask.

Enter one of these ratings:
0 = The subtask HAS a built-in logic.
1 = The subtask DOES NOT HAVE a built-in logic.

LEARNING DIFFICULTY

5. What are the mental requirements of the subtask?

Definition - Repetitive, physical subtasks require almost no mental work. Many subtasks that look easy require a lot of mental work, such as planning an attack or trouble-shooting a complex piece of equipment. Consider the number of decisions or calculations that must be made in choosing your answer. Also consider the impact of any job aid.

Enter one of these ratings:

0 = The subtask IS NOT mentally demanding.
3 = The subtask IS mentally demanding.

LEARNING DIFFICULTY

6. What are the motor control demands of the subtask?

Definition - Motor control refers to precise finger, hand, or arm movements, not to large body movement. Sheer physical strength does not require much motor control. Tracking a target and repairing a gauge require a lot of motor control.

Enter one of these ratings:

0 = The motor control demands are SMALL.
3 = The motor control demands are LARGE.

QUALITY OF TRAINING - ACQUISITION

Consider what you know about the training device, a typical instructor (if there is one), the skills and knowledge that the typical traineé must learn, and how device will be used.

For this subtask, answer the following 11 questions.

1. To what extent will the training system tell trainees, at key stages of training, the training objective of this subtask and their current standing relative to the objective?
0 = Not at all - trainees are never told the training objective nor are they told their standing relative to the objective.

100 = Completely - trainees are told the training objective and their standing relative to the objective throughout training.

2. To what extent will the trainee begin with easy examples of this subtask and progress to more difficult examples?

0 = Not at all - the material to be learned is not sequenced in terms of difficulty.

100 = Completely - the material to be learned is sequenced in terms of difficulty from easy to hard.

3. To what extent will the training system tell the trainees what they did and how well they did it?

0 = Not at all - the training system provides trainees with no information about their performance.

100 = Completely - the training system provides trainees with explicit information about what they did and how well they did it.

4. To what extent will the training system provide enough practice of this subtask?
0 = Minimum practice - there is no practice, rehearsal, or repetition of this subtask.

100 = Maximum practice - there is extensive practice, rehearsal, or repetition of this subtask.

ZZ03 ******************************************
QUALITY OF TRAINING - ACQUISITION ASTAR 3

5. To what extent will the training system provide help (such as prompts and cues) to trainees early in training and gradually fade this help out as training progresses?

<table>
<thead>
<tr>
<th>0</th>
<th>10</th>
<th>20</th>
<th>30</th>
<th>40</th>
<th>50</th>
<th>60</th>
<th>70</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>100</td>
</tr>
</tbody>
</table>

0 = Not at all - training help is not provided.

100 = Completely - the training system provides help early in training and gradually fades it out late in training.

ZZ03 ******************************************
QUALITY OF TRAINING - ACQUISITION ASTAR 3

6. To what extent will the training system organize the material to be learned into small blocks or steps?

<table>
<thead>
<tr>
<th>0</th>
<th>10</th>
<th>20</th>
<th>30</th>
<th>40</th>
<th>50</th>
<th>60</th>
<th>70</th>

</thead>
<tbody>
<tr>
<td>O</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>100</td>
</tr>
</tbody>
</table>

0 = Not at all - the material to be learned is not well organized.

100 = Completely - the material to be learned is well organized.

ZZ03 ******************************************
QUALITY OF TRAINING - ACQUISITION ASTAR 3

7. To what extent does the training system use memory aids to help train?

<table>
<thead>
<tr>
<th>0</th>
<th>10</th>
<th>20</th>
<th>30</th>
<th>40</th>
<th>50</th>
<th>60</th>
<th>70</th>

</thead>
<tbody>
<tr>
<td>O</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>100</td>
</tr>
</tbody>
</table>

0 = Not at all - although memory aids could be used, the training system does not use them.

100 = Completely - the training system uses memory aids to help learning when they are appropriate.

ZZ03 ******************************************
QUALITY OF TRAINING - ACQUISITION

8. To what extent does the training system start with a wide tolerance for errors, narrowing the tolerance as training progresses?

0 = Not at all - error tolerances are not varied as training progresses.
100 = Completely - error boundaries are broad at the start of training and become narrow late in training.

9. To what extent does the training device provide a variety of examples of this subtask?

0 = Not at all - the device presents only one version of this subtask.
100 = Completely - the device presents a wide variety of examples of this subtask.

10. To what extent does the training system present difficult examples of this subtask?

0 = Not at all - the device presents only easy examples of this subtask.
100 = Completely - the device presents the most difficult examples of this subtask.

11. To what extent can the training system present different examples of this subtask as a function of the trainee's performance?
0 = Not at all - the device provides lock-step instruction; training is not interactive.

100 = Completely - the program of instruction is varied as a function of trainee performance; the device provides for interactive training.

RESIDUAL DEFICIT

Assume that the trainees have completed training and are proficient on all subtasks in the training device. Examine the performance objectives and the description of each operational subtask.

Rate how well the typical trainee will be able to perform each subtask in the operational situation. Enter your rating using the following definitions.

Rating Definition

0 = Cannot perform this subtask. Has had no previous training.

1 = Cannot perform this subtask. Has had orientation training only.

2 = Can perform this subtask only if assisted in every step. Has had familiarization training only.

3 = Can perform this subtask but needs more training. Has had procedural training.

4 = Can perform this subtask completely and accurately. Has received skill training.

RESIDUAL LEARNING DIFFICULTY

Consider the skills and knowledge that a graduate of the training device still must learn in order to meet the operational performance objectives for this subtask (the Residual Deficit that you identified).

Answer the following six questions.

3-20
1. Will the trainee use job aids or memory aids to perform this subtask in the operational setting?

Definition - Job and memory aids assist in doing a subtask correctly. Some examples are:

- Documents (SM, Tech Manuals, etc.),
- Instructions printed on the equipment, and
- Memory joggers (S-A-L-U-T-E).

Enter one of these ratings:

0 = Job or memory aids ARE used
1 = Job or memory aids ARE NOT used.

ZZ05 *****************************************
RESIDUAL LEARNING DIFFICULTY ASTAR 3

2. How many steps are required to do this subtask?

Definition - A step is a separate physical activity with well defined, observable beginning and end points. A subtask may have one step (identify enemy vehicles) or many steps (those involved in disassembling a rifle).

Enter one of these ratings:

0 = The subtask contains LESS than 10 steps.
1 = The subtask contains MORE than 10 steps.

ZZ05 *****************************************
RESIDUAL LEARNING DIFFICULTY ASTAR 3

3. Must the trainee perform the steps in this subtask in sequence?

Enter one of these ratings:

0 = The subtask steps DO NOT have to be performed in order.
1 = The subtask steps MUST BE performed in a specific order.

ZZ05 *****************************************
RESIDUAL LEARNING DIFFICULTY ASTAR 3

4. Does the subtask have a built-in logic so that the trainees know when they are doing it correctly?

Definition - Some subtasks consist of steps that form a logical or natural sequence, like fixing a tire or changing a light bulb. Other subtasks have steps that seem arbitrary, like many trouble-
shooting subtasks. Some subtasks contain a mixture of "natural" and "unnatural" steps. For example, safety steps often break the natural flow and logic of a subtask.

Enter one of these ratings:

0 = The subtask HAS a built-in logic.
1 = The subtask DOES NOT HAVE a built-in logic.

5. What are the mental requirements of the subtask?

Definition - Repetitive, physical subtasks require almost no mental work. Many subtasks that look easy require a lot of mental work, such as planning an attack or trouble-shooting a complex piece of equipment. Consider the number of decisions or calculations that must be made in choosing your answer. Also consider the impact of any job aid.

Enter one of these ratings:

0 = The subtask IS NOT mentally demanding.
3 = The subtask IS mentally demanding.

6. What are the motor control demands of the subtask?

Definition - Motor control refers to precise finger, hand, or arm movements, not to large body movement. Sheer physical strength does not require much motor control. Tracking a target and repairing a gauge require a lot of motor control.

Enter one of these ratings:

0 = The motor control demands are SMALL.
3 = The motor control demands are LARGE.

Physical similarity is based on a comparison of the physical characteristics of the training system and the operational system.

Compare the location, appearance, and feel of the controls and displays in the training system with the controls and displays in the operational system. Compare the environmental conditions (lighting, temperature, noise levels, etc.) in the training system with the conditions in the operational system.
For this subtask, rate the physical similarity between this operational control or display and its corresponding control or display in the training system. Use the following scale:

0 = Different - the trainee will notice a large difference between this control/display in the training device and in the operational equipment.

100 = Identical - the trainee will not notice any difference between this control/display in the training device and in the operational equipment.

Functional similarity is based on how the controls and displays work in the training device and in the operational equipment.

Do the corresponding controls work the same way in the training device and in the operational equipment? Do the corresponding displays show the same information in the training device and in the operational equipment?

For this subtask, rate the functional similarity between this operational control or display and its corresponding control or display in the training device. Use the following scale:

0 = Different - this control/display works differently in the training device and in the operational equipment.

100 = Identical - this control/display works the same way in the training device and in the operational equipment.

Consider what you know about the training device and operational situation, a typical instructor (if there is one), and how the device will be used.
For this subtask, answer the following eight questions.

**QUALITY OF TRAINING - TRANSFER**

**ASTAR 3**

1. To what extent is the subtask that must be learned in the training device similar to the subtask that is performed in the operational situation?

```
0  10  20  30  40  50  60  70  80  90  100
```

0 = Not at all - the device subtask is not similar to the operational subtask.

100 = Completely - the device subtask is identical to the operational subtask.

2. To what extent are features of the operational setting presented in the training device?

```
0  10  20  30  40  50  60  70  80  90  100
```

0 = Not at all - the device does not present any features of the operational setting for this subtask.

100 = Completely - the device presents all the features of the operational setting for this subtask.

3. To what extent will the training system make clear to the trainee the relationship between the training objective and the operational objective for this subtask?

```
0  10  20  30  40  50  60  70  80  90  100
```

0 = Not at all - the relationship of training objective to the operational objective is not made clear to the trainee.

100 = Completely - the relationship of the training objective to the operational objective is made clear to the trainee.
4. To what extent later in training does the training system gradually reduce training help for this subtask?

0 = Not at all - training help is not reduced toward the end of training.
100 = Completely - training help is gradually faded out.

5. By the end of training on the device, to what extent do the trainees see and do the the same things that they will see and do in the operational situation?

0 = Not at all - trainees see and do different things in the training device than they see and do in the operational situation at the end of training.
100 = Completely - trainees see and do the same things in the training device that they see and do in the operational situation at the end of training.

6. To what extent will the training system permit trainees to practice in the device until they can demonstrate a job entry level of skill on this subtask?

0 = Not at all - the amount of practice trainees receive will not enable them to perform at a job entry skill level.
100 = Completely - the amount of practice trainees receive will enable them to perform at a job entry skill level.
QUALITY OF TRAINING - TRANSFER

7. To what extent will the training system provide overlearning to enable trainees to cope with stressful real-world situations when performing this subtask?

[Graph]

0 10 20 30 40 50 60 70 80 90 100

0 = Not at all - the training system does not provide overlearning of this subtask.

100 = Completely - the training system will permit trainees to overlearn this subtask.

QUALITY OF TRAINING - TRANSFER

8. To what extent will the training system provide for practice that spans the range of operational situations for this subtask? (For example, easy to difficult problems, various signal sources and patterns, etc.)

[Graph]

0 10 20 30 40 50 60 70 80 90 100

0 = Not at all - the conditions under which practice occurs are constant and represent a small portion of the operational situation.

100 = Completely - practice occurs under a broad range of conditions that span the operational situation.

HELP: ASTAR analyses can be performed at three different levels. Which level to use depends upon the amount of information you have about the training system, operational equipment, the tasks to be trained, and the trainees themselves. The more specific the information, the higher the level you can use in ASTAR. For examples of required information at each level, refer to the ASTAR II Tutorial.

PERFORMANCE DEFICIT

Examine the training objectives and consider what you know about the typical trainee's background, work experience, and prior training. What proportion of the skills and knowledge required by the training objectives will the typical trainee have to learn in order to reach criterion performance on the training device?

Enter this proportion using the following scale:

0  20  40  60  80  100

0 = None - the trainee does not have to learn anything.

100 = All - the trainee has to learn all of the skills and knowledge needed to meet the training objectives.

Enter Rating -999

QUALITY OF TRAINING - TRANSFER

Consider what you know about the training device and operational situation, a typical instructor (if there is one), and how the device will be used.

What percentage of the tasks that must be learned in the training device are similar to the tasks that are performed in the operational situation?

Rate the percentage using the following scale:

0 = None - none of the training tasks are similar to the operational tasks.

100 = All - all of the training tasks are identical to the operational tasks.

Task.Subtask =

LEARNING DIFFICULTY

Consider the skills and knowledge needed to meet the training objectives for this subtask that the trainee must learn (the Performance Deficit that you identified). Answer the following.

Will the trainee use job aids or memory aids to perform this subtask in the training device?

Definition - Job and memory aids assist in doing a subtask correctly. Some examples are:
- Documents (Tech manuals, etc.),
- Instructions printed on the equipment, and
- Memory joggers (S-A-L-U-T-E).

Enter one of these ratings:
0 = Job or memory aids ARE used.
1 = Job or memory aids ARE NOT used.

Task.Subtask =
Enter Rating -999
How many steps are required to do this subtask?

Definition - A step is a separate physical activity with well defined, observable beginning and end points. A subtask may have one step (identify enemy vehicles) or many steps (those involved in disassembling a rifle).

Enter one of these ratings:

The following two Rating Categories are not made on a task basis.

**Quality of Training-Acquisition**
1. Directions Provided = XX
2. Practice Provided = XX
3. Feedback Provided = XX
3. Varying Practice Levels = XX

**Quality of Training-Transfer**
1. Similar Performance = XX
2. Similar Conditions = XX
3. Extensive Practice = XX
