INTRODUCTION

The work program for the Seattle Center economic and conceptual development study was divided into three phases, of which the present second phase addresses three alternative redevelopment concepts for the site together with associated attendance estimates and, where applicable, facility sizing guidelines. Pictorial and narrative descriptions of the three concept options have been submitted under separate cover; this companion document contains the attendance and sizing estimates pertinent to the three plans. Following this introduction, a summary text and accompanying tables highlight the principal findings and conclusions, while the detailed analysis, including supporting documentation, is presented as a Statistical Appendix.

The Seattle Center study is the product of a joint venture between Walt Disney Imagineering, Inc. as conceptual designer, represented by Juliann Juras and Gordon Hoopes, and Harrison Price Company as economic consultant, represented by Harrison A. Price and Nicholas S. Winslow. In the capacity of subcontractors, Peter Moy & Associates and Sharon J. Dalrymple provided analytical support.

The conclusions reached in this report are based on the study team's present knowledge of the Seattle market and competitive environment as of completion of field work in March 1988. As in all studies of this type, projected results are predicated on competent and efficient management of the Center's component attractions and presume no significant difference in competitive position from that set forth in this report. Since annual operating results are based on estimates and assumptions that are subject to an indeterminate amount of uncertainty and variation, particularly at this early stage in the planning process, they are explicitly not represented as results that will actually be achieved. Additionally, the study does not include the possible impact of government restrictions on the subject development except those identified in the report.

Outside the scope of this study contract, HPC prepared, at the special request of the client, rough estimates of capital costs for first-phase common improvements under the three alternative development concepts. These estimates were submitted as part of the Interim Report for Phase II delivered May 10, 1988. At the instruction of the client, no further work on capital costing will be done until a complete feasibility analysis is prepared for the recommended project concept in Phase III of the study.

SUMMARY FINDINGS

Subsequent paragraphs summarize the expected attendance performance of each concept alternative and then translate attendance volume into demand for food and merchandise facilities and parking. All estimates, it should be noted, are preliminary and, in the case of the plan alternative ultimately recommended for detailed exposition in Phase III, subject to revision and refinement. Further, all estimates refer to a typical stabilized year of operation, which will occur three to four years after the opening of each component facility. Attendance prior to stabilization will likely be substantially
less than that estimated here due to the necessary period of build-up in market response and dislocations caused by the construction program; attendance after stabilization will increase in general accordance with overall market growth to the extent possible given inherent capacity constraints on component facilities.

EXISTING ATTENDANCE BASE

A brief review of Seattle Center's existing attendance base as previously discussed in the Phase I report for this study assignment will establish a context for the attendance projections to follow. Table 1 shows that aggregate resident and tourist market size currently amounts to about 7 million persons. Population of the primary resident market, or King County, is some 1.36 million, while the secondary resident market (comprised of Kitsap, Pierce, and Snohomish counties) has a total population of about 1.1 million. No official estimates as to the size of the Seattle area tourist market are available; however, extrapolations from hotel capacity and studies by developers currently active in the market (Rouse Company and others) suggest that overnight tourist volume is in the range of 4 to 5 million visitors annually. A midpoint estimate of 4.5 million has been used for purposes of this analysis, as indicated.

The Phase I report noted that total visitation to Seattle Center is believed to be on the order of 8 million as of 1986. The local market surveys conducted as part of that study phase revealed the attendance distribution within the resident market by county. Additional surveys undertaken by the various tenant organizations at Seattle Center suggest that the tourist proportion of the total is approximately 20 percent. On the basis of the latter estimate, percentages associated with each resident market segment in the local market survey were redistributed over an expanded base including tourism, yielding the overall distribution shown in Table 2. When adjusted attendance shares are divided by corresponding market size figures, resulting market penetration rates amount to about 380 percent for the City of Seattle, some 260 percent for the remainder of King County, slightly more than 200 percent for the three-county secondary resident market, and 36 percent for the tourist market (penetration rates in excess of 100 percent reflect repeat visitation—Seattle residents, for example, visit the Center roughly four times per year on average). The overall capture rate for the Center is an outstanding 115 percent.

While the foregoing overview of current attendance performance is impressive, Seattle Center is nevertheless highly vulnerable to changing market conditions, and the task of maintaining attendance volume somewhere near the 8 million level should not be underestimated. The Sonics are leaving, competition for meeting, trade show, and food/retail business is increasing markedly, many Center facilities are losing appeal as they become more and more outmoded and/or deteriorated, and certain tenant organizations are prevented from expanding their programs due to capacity constraints or the lack of suitable facilities altogether. Without a comprehensive redevelopment program such as being formulated in the present study, a pronounced and irreversible decline in total visitation can be anticipated.

PROJECTED ATTENDANCE BASE

Subsequent paragraphs derive attendance estimates for each of the three alternative redevelopment concepts, including facilities to be retained more or less "as is," new or refurbished facilities common to all three alternatives, and additional facilities recommended for development under one or more of the concept options.

Retained Facilities

Facilities to be retained essentially unchanged under all three conceptual plans include the Space Needle, Pacific Science Center, Opera House, Bagley Wright Theater/Poncho Forum, and the grounds at large (in the sense of use for major festivals and other special events). Attendance volume for these facilities as of 1986 totaled approximately 3.2 million, as indicated in Table 3. Given publicity generated by the grand reopening of Seattle Center after redevelopment, the provision of new and different entertainment opportunities at the Center, and civic pride in the "crown jewel" of the Emerald City, it is reasonable to expect an incremental increase in attendance for these facilities collectively estimated on the order of 10 to 20 percent, for an ultimate stabilized volume of 3.6 to 3.9 million in the aggregate. This increase will not occur across the board, but will instead vary widely among the individual facilities in consideration of capacity limitations and/or financial constraints on program expansion.

Common Elements

A number of facilities, new or refurbished, will be common to all master plan alternatives given the study team's opinion that there is a fundamental level of redevelopment which must occur regardless of the ultimate nature and scope of each plan in its entirety. Table 4 shows that in Phase I, these common elements encompass a new Center House, a themed children's play center, two children's theaters (500 seats and 200 seats, respectively), and a children's museum and library, plus the recently revamped Intiman Playhouse and the Pacific Northwest Ballet School already scheduled for construction as a new second floor in the Exhibition Hall. Combined attendance for these various attractions is estimated to be about 1 million at stabilization which, when added to the attendance base for retained facilities, brings overall first-phase common attendance to between 4.6 and 5 million.

Common elements in Phase II embrace theater district restaurants and shops, an expanded crafts/fine arts component, and extension of the downtown Seattle trolley line into Seattle Center. These various elements will not add a substantial increment to attendance at the Center; rather, demand for such facilities will arise in response to attendance generated by other attractions at the site. The chief impact of these facilities, accordingly, is qualitative rather than quantitative as they will enhance the overall ambience of the site and favorably affect average visitor length of stay and hence spending propensity.

Common elements of the third and final development phase include a new (as yet undefined) museum in the Nile Temple building and a new 2,500-seat concert hall on the Kreielsheimer property. Aggregate estimated attendance for these components is 370,000 to 560,000.

¹ Includes Space Needle, Pacific Science Center, Opera House, Bagley Wright Theater, Poncho Forum, and grounds at large (including major festivals).

² Common improvements in Phase II will not add significant incremental attendance, but rather will derive support from aggregate visitation to the site as a whole.

N.A. means not applicable.

Source: Harrison Price Company.
Cumulative attendance generated by all retained or new common project components is projected at 4.9 to 5.5 million, as indicated. Appendix Tables A-1 through A-8 contain detailed attendance analyses for common elements, including notation of planning factors employed. The following explanatory comments are pertinent:

- The present event load of the Center House stage and court area will be transferred essentially intact to the new Center House. Since programming of this facility is already intense at almost three events per day on average, little calendar space is available for program expansion. A modest allowance for 30 to 50 additional events (or up to one additional program per week) has been assumed, which will result in a stabilized attendance volume of 332,000 to 339,000 annually.

- Attendance at the themed children's play center has been based on an overall resident/tourist market capture rate of 3 to 3.5 percent, equivalent to an absolute volume of between 198,000 and 247,000, which is consistent with experience at well located comparable attractions.

- Children's theater attendance, estimated at 178,000 to 191,000 for Seattle Children's Theater and 56,000 to 60,000 for the smaller theater (World Mother Goose and Piccoli Junior Theater), is based on seating capacity and information supplied by the respective user organizations as to program capabilities and typical seat occupancy experience.

- Using methodology comparable to that for the children's theaters, stabilized annual attendance for the new symphony hall is estimated at 250,000 to 279,000, while the estimate for the Intiman Playhouse is 52,000 to 56,000.

- The children's museum and library estimate of 163,000 to 169,000 was based on an incremental increase of 30 to 35 percent over existing volume given enlarged facilities and an upgraded program.

- An estimate of 22,000 to 26,000 annually has been projected for the Pacific Northwest Ballet School on the basis of class schedules and average enrollment as provided by ballet management.

- Estimating attendance for the Nile building museum is problematical in the absence of precise definition of museum scope and content. However, assuming a competitive attraction with moderate admission prices and strong membership support, an overall resident/tourist market capture of 2 to 4 percent has been projected, equivalent to between 120,000 and 281,000 visits annually.

Common and retained facilities generating a cumulative total of 4.9 to 5.5 million visits in the aggregate as mentioned previously comprise the core of the Seattle Center redevelopment program. Over and above these elements are a number of other attractions specific to the various master plan alternatives, which are discussed in the paragraphs to follow.
The first phase of redevelopment under Plan A calls for refurbishment of the Coliseum as a flat-floor exhibit and family show/rock concert venue, renovation and expansion of meeting facilities at Seattle Center, and the addition of children's rides to the children's zone at the site. As summarized in Table 5, combined attendance for these three elements is estimated at 997,000 to about 1.1 million, bringing overall Phase I volume under this plan (including retained and common facilities) to between 5.6 and 6.1 million visits. In Phase II, a temporary amphitheater of 4,000 lawn seats will be added, together with a thrill ride park on the Metro bus property. Combined attendance in this instance is estimated at 689,000 to 887,000. In the third phase of development, the amphitheater will be upgraded to permanent status at 5,000 seats, 3,000 of which will be fixed and 2,000 lawn. The incremental gain in amphitheater attendance over Phase II is projected to amount to 87,000 to 100,000 visits, for a third-phase aggregate volume including common facilities of 457,000 to 660,000 visits.

Detailed attendance analyses for these additional elements are presented in Appendix Tables A-9 through A-17 and incorporate the following assumptions:

- Nonsports programming at the Coliseum amounted to 98 event-days in 1986. An additional 85 nonsports event-days were recorded at the Arena to be demolished on implementation of the redevelopment program for Seattle Center, for a combined existing activity base of 183 events. Assuming that the refurbished Coliseum makes provision for flexible seating capacities enabling transfer of much of the Arena's nonsports calendar but, on the other hand, taking into account increased competition in the market area in tandem with the basic shortcomings of the Coliseum structure, a net loss of 25 to 35 percent of the combined Coliseum/Arena nonsports event base is considered realistic. The remaining 120 to 135 event-days will generate an estimated attendance volume of 468,000 to 527,000 at stabilization.

- Meeting/exhibit facilities at Seattle Center (including the Northwest Rooms, Center House Conference Center, Mercer Forum, Exhibition Hall, Flag Pavilion, and NASA Building) generated an aggregate of 1,550 event-days during 1986. Under Plan A, meeting space will be expanded somewhat even after allowing for demolition of the Flag Pavilion, Conference Center, and NASA Building which, coupled with extensive physical upgrading and a favorable rental price strategy, will tend to offset the factor of increased competition in the marketplace. The projected loss in the existing event base is accordingly estimated at no more than 5 percent, for an overall event load of 1,470 to 1,550 days. Estimated attendance for these events amounts to 529,000 to 558,000 in the aggregate.

- An attendance range of 148,000 to 178,000 has been forecast for the temporary amphitheater on the basis of seating capacity, an event load of 70 to 85 events per year (which presumes aggressive marketing and a major in-house promotion effort), and seat occupancy factors consistent with the likelihood that uncovered lawn seats are difficult to sell except in the case of extremely popular shows. When this venue is upgraded in the second phase as a permanent amphitheater, increased seating capacity, improved occupancy resulting from the

¹ Children’s rides will not add significant incremental attendance, but rather will increase average length of stay in the children’s zone.

NA means not applicable.

Source: Harrison Price Company.
availability of fixed seats, and a slightly higher event load (80 to 95 event-days per year) will produce a total attendance of between 235,000 and 278,000, or 87,000 to 100,000 more than in the first phase.

- The addition of children's rides is not expected to induce appreciable incremental attendance within the children's zone as a whole. This facility will nonetheless have an important qualitative impact through its tendency to augment average visitor length of stay and rate of spending.

- The proposed thrill ride park is projected to generate total attendance in the range of 541,000 to 709,000 at stabilization. This estimate is based on a healthy overall resident/tourist market capture rate of 8 to 10 percent in recognition of the uniqueness of this attraction in the marketplace (penetration of the target teen/young adult age group, it should be noted, will be dramatically higher).

Cumulative attendance for all three phases of Plan A, including retained, common, and additional project components, comes to 6.7 to 7.1 million visits before allowing for unallocable attendance associated with casual visitation to the grounds and minor activities for which attendance is not reported or under-reported. Seattle Center's existing attendance base includes an estimated 800,000 such visits, equivalent to 12 percent of the total. If a similar proportion prevails in the future, adjusted total attendance volume at the Center under Plan A would amount to between 7.5 and 8.5 million.

Additional Elements Under Plan B (Regional Family Entertainment)

The Plan B concept alternative calls for meeting room refurbishment and addition of children's rides in Phase I, bringing combined first-phase attendance volume, summarized in Table 6, to between about 5 and 5.5 million with inclusion of retained and common facilities. A temporary amphitheater of 4,000 seats, a thrill ride park on the Metro site, and an ice rink in a redesigned Coliseum are the additional elements of Phase II, together yielding an aggregate attendance volume of 825,000 to some 1.1 million. In the third phase, the temporary amphitheater will be replaced by a permanent facility containing 7,700 seats (2,000 lawn, 2,400 fixed open, and 3,300 fixed covered seats), and a teen dance pavilion will be added to the Metro site. Total Phase III attendance volume is projected at 692,000 to 982,000 visits for the latter facilities plus common elements. Taken into account in the detailed attendance computations presented in Appendix Tables A-16 through A-19 are the following assumptions:

- Projections for meeting/exhibit facilities allow for a net decrease in available meeting space at the site plus heightened competition in the marketplace. A 20 to 30 percent loss in the existing event base is forecast, for an overall event load of 1,085 to 1,240 days and an estimated attendance of 391,000 to 446,000 under this plan alternative.

- Temporary amphitheater attendance is the same as under Plan A, or 148,000 to 178,000 annually. In the case of the permanent amphitheater, attendance vol

\(^1\) Children's rides will not add significant incremental attendance, but rather will increase average length of stay in the children's zone.

NA means not applicable.

Source: Harrison Price Company.
ume will grow to 389,000 to 458,000 given significantly larger seating capacity and occupancy factors commensurate with the high proportion of fixed seats, 40 percent of which will be covered. The incremental gain over the temporary configuration will thus amount to 241,000 to 280,000 visits.

- As in the case of Plan A, no incremental gain in attendance is expected to be generated by the children's rides.

- Estimated thrill ride park attendance of 541,000 to 709,000 is the same as under Plan A.

- Attendance at the teen dance pavilion was factored as a 15 to 20 percent increment to thrill ride park attendance, or an additional 81,000 to 142,000 visits. In contrast to the children's rides, where impact is essentially qualitative, this attraction is expected to have both qualitative and quantitative benefits, specifically in the form of increased nighttime business.

- Ice rink attendance is forecast at 136,000 to 164,000 at stabilization based on a substantial 25 to 30 percent penetration of the local ice skating market (comprised of 4 percent of the primary resident market population) in recognition of the fact that there is only one competing rink in King County. The nature of the proposed ice facility, which will not be suited for hockey (with the possible exception of Little League games) along with inherent capacity constraints suggest that this is the maximum attainable.

For Plan B at full development on completion of third-phase improvements, cumulative attendance volume is estimated at 6.5 to 7.5 million. Adding a 12 percent increment for unallocable visits, overall cumulative attendance will range from 7.2 to 8.3 million visits.

**Additional Elements Under Plan C (Community Park/Arts Center)**

Meeting room refurbishment is the only major additional element envisioned for the first phase of Plan C. When combined with retained and common facilities, total Phase I attendance under this plan will amount to roughly 5 to 5.5 million, as indicated in Table 7. An ice rink at the Coliseum site and an active sports complex on the Metro site (encompassing such sports as baseball, basketball, tennis, bicycling, and so on) are proposed for Phase II, which will yield an additional 482,000 to 625,000 visits. No additional improvements are envisioned for Phase III, with total attendance of 370,000 to 560,000 in this phase associated only with common elements described earlier. Drawing on the detailed analysis contained in Appendix Tables A-13 through A-15 and A-19 through A-22, comments pertaining to Plan C are as follows:

- Assumptions concerning meeting/exhibit facilities are the same as under Plan B, with stabilized attendance estimated at 391,000 to 446,000 annually.

- Ice rink attendance is also the same as under Plan B, or 136,000 to 164,000 visits.

Source: Harrison Price Company.
Projected attendance for the active sports complex is based on national average participation rates in selected sports together with typical frequency of participation factors. Activities of this nature (as well as ice skating) are ordinarily enjoyed close to home, implying that the effective market does not extend beyond King County. This local market is estimated to generate some 46 million visits annually in ten selected types of sports (baseball, basketball, softball, and soccer in the field sports category, volleyball, tennis, and archery in the court sports category, and bicycling, running/jogging, and roller skating in the trail sports category). At this stage in the planning process, it is not known what the precise mix of sports will be at the Metro site, nor has the relative emphasis on certain sports versus others been identified. This uncertainty, coupled with capacity limitations and the vast array of competing sports venues—including schools and colleges, other public parks, and even local residents' own backyards—suggests that an estimated market penetration rate of 0.75 to 1 percent is generous. Absolute attendance volume is thus liberally estimated at 346,000 to 461,000 visits at stabilization.

Cumulative Plan C attendance including all common elements plus the additional facilities described above is projected at 5.8 to 6.6 million visits. An allowance for unallocable attendance comparable to that of the other two plans brings overall volume to between 6.5 and 7.4 million.

Comparison of the Three Plans

A summary comparison of attendance volume under Plans A, B, and C is presented in Table 8. The text table below shows the cumulative, aggregate attendance for each option after adjusting for unallocable visits:

<table>
<thead>
<tr>
<th>Plan</th>
<th>Estimated Total Attendance (thousands)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plan A</td>
<td>7,510-8,520</td>
</tr>
<tr>
<td>Plan B</td>
<td>7,250-8,350</td>
</tr>
<tr>
<td>Plan C</td>
<td>6,500-7,400</td>
</tr>
</tbody>
</table>

Potential attendance generation under Plans A and B, as indicated, is very similar; however, there are important differences in the source of attendance for the two concepts. The success of Plan A is in large measure contingent on aggressive and costly marketing of trade show, meeting, and exhibit facilities in the face of stiff competition. Plan B has greater orientation to the more predictable family entertainment market and implies less risk due to reduction of the meeting component. Attendance-wise, Plan C is inferior to both of the other two concept options and has the further disadvantage of increasing the relative incidence of low-revenue activity through the use of the Metro site for participant sports. Plans A and B, in short, are capable of maintaining Seattle Center's present market share at or above 8 million, whereas Plan C will generate up to 1.5 million visits less than currently experienced.

PROJECTED DEMAND FOR FOOD AND RETAIL FACILITIES

The foregoing attendance estimates provided the basis for determining food service and retail space demand at Seattle Center. Summarized in Table 9 are the space requirements under each master plan alternative as drawn from the detailed analysis presented in Appendix Tables A-23 through A-25. Underlying assumptions included the following:

1. The local market survey conducted during Phase I of this study program revealed an average expenditure at Seattle Center of about $16.50 per party per visit excluding entrance fees and tickets where applicable but including parking. Extrapolations from current parking revenue at the site suggest that parking fees account for approximately $1 of the total expenditure (a substantial proportion of all visitors park free of charge), leaving a balance of $15.50 for food and merchandise. Dividing the latter figure by an average party size of 3.52 persons as determined in the survey yields an average food and merchandise expenditure of about $4.40 per capita. Present experience at the Center House suggests that roughly 70 percent of this total, or slightly more than $3, is expended on food and the balance on merchandise. One strategy for the Center might be an attempt at changing this distribution in the direction of a higher merchandise share, but this analysis has assumed continuance of the existing relationship.

2. Under Plan A, the study team has assumed that visitor spending would remain more or less at present levels in constant dollar terms, with the loss of sports-related spending at the Coliseum and Arena offset by spending at new facilities to be developed at the site. Under Plan B, moderate net increases in spending levels have been assumed given this concept's somewhat greater orientation to comparatively high-revenue activities. The assumption for Plan C is a modest net decrease in average spending due to the substitution of low-revenue participant sports for the thrill ride/teen dance component on the Metro site and the exclusion of the amphitheater that is part of the other two plans.

3. Target sales ratios, set at $500 per square foot for food facilities (based on a mix of fast food stands and full-service restaurants) and $750 per square foot for merchandise outlets, are purposely high in order to ensure profitable levels of operation.

As Table 9 shows, attendance estimates coupled with the above assumptions result in cumulative demand for food service space amounting to 43,500 to 50,000 square feet of restaurant space or equivalent in snack stand through-put capacity under Plan A, 48,500 to 55,500 square feet under Plan B, and 34,000 to 40,000 under Plan C. These estimates, it should be noted, include existing or planned food service area at the Space Needle, Pacific Science Center, and catered functions elsewhere on site. On refinement of the demand analysis for the recommended concept in Phase III of this study, various adjustments will be made to these estimates in order to determine net incremental demand.

¹ Based on estimated mid-range attendance volume; includes existing or planned facilities at Space Needle and Pacific Science Center.

Source: Harrison Price Company.
Supportable merchandise sales space totals a cumulative 12,500 to 14,500 square feet under Plan A, between 14,000 and 16,000 square feet under Plan B, and 8,500 to 10,500 square feet under Plan C. Again, these estimates are inclusive of sales facilities at retained attractions.

ESTIMATED PARKING REQUIREMENTS

The required number of parking spaces at Seattle Center under each of the concept options is highlighted in Table 10 based on the detailed analysis presented in Appendix Tables A-26 through A-32. Relevant explanatory comments include:

- Maximum parking demand will occur during daytime hours, at which time an overall weighted average of 70 percent of total visits to the site will occur (this ratio will prevail with little variation across the range of redevelopment scenarios).

- Average length of stay for daytime visitors was revealed in the previously cited local market survey at some 2.8 hours. New entertainment opportunities provided at the site under any of the plans should produce an upward trend in stay times, conservatively forecast at 3 to 3.5 hours at stabilization.

- The local market survey also revealed an average party size of 3.5 persons for most activities, with a smaller average of around 2.25 persons for performing arts events as would be expected. The larger factor was employed for daytime business in the parking analysis, and the smaller factor for nighttime business, which is predominantly arts-oriented.

- Arrivals by automobile currently amount to roughly 90 percent of total attendance as determined in the local market survey. This ratio is presumably higher than historical experience due to the present disruption in Monorail service due to construction at the Westlake end of the line. With restored Monorail service and a future trolley link to Seattle Center, the auto proportion should decline. For conservative planning purposes, a range of 80 to 90 percent auto arrivals was used in this analysis.

- Parking requirements have been based on estimated mid-range attendance volume for each component facility before adjustments for shared visitation (attendees who undertake more than one activity on a single visit) and the increment of unallocable attendance as discussed earlier in this report. The latter offsets the former to an indeterminate degree; as a preliminary and conservative planning guideline, no net reduction in parking requirements due to shared visitation was assumed. Phase III of this study will refine the parking analysis for the recommended plan to incorporate these and any other necessary adjustments.

</table>

1 Based on estimated mid-range attendance volume; excludes employee parking and provision for major festivals.

Source: Harrison Price Company.
Given the aforementioned factors, cumulative maximum (daytime) parking requirements for Plan A amount to between 4,260 and 4,790 spaces, while evening demand comes to a lower 2,875 to 3,235 spaces. Under Plan B, the daytime peak requirement is 4,005 to 4,505 spaces and the peak evening need is 3,005 to 3,375 spaces. A maximum total of 3,810 to 4,285 spaces will be required under Plan C, with evening demand estimated at 2,315 to 2,595 spaces. It should be noted that these preliminary forecasts exclude employee parking and special provision for major festivals when exceptionally large numbers of people are on-site simultaneously.
